### **Health and Safety**

**This appliance is not intended for use by persons (including children) with reduced physical, sensory or mental capabilities, or lack of experience and knowledge, unless they have been given supervision or instruction concerning use of the appliance by a person responsible for their safety.**

**Children should be supervised to ensure that they do not play with the appliance.**

## **1.0 HOW THE CALOREX 'SERIES 3 VARIHEAT' SYSTEM WORKS.**

The Calorex 'SERIES 3 VARIHEAT' range consists of 4 models: 600/900/1200/1500.

The model number increases in relation to the recirculated air flow from model 600 at 2000 m<sup>3</sup>/h to model 1500 at 4300 m<sup>3</sup>/h.

600 and 900 models are fitted with constant flow fans and deliver the optimum airflow, self compensating for pressure differentials in the system.

All models are fitted with either one or two "console fixing service panels" These allow for the console to be fixed to the Variheat 3. These service panels can be fitted on any face of the machine.

When optional fresh air box is fitted, all models have the facility to exhaust a percentage of the recirculating air and introduce a slightly lesser amount of fresh air (slight differential creates a negative pressure on pool hall to localise pool environment and protect the building fabric).

An optional "negative pressure box" is also available. This exhausts a percentage of the circulating air without introducing fresh air to the pool hall.

Optional, factory fitted frost protection kits are available, for use when the fresh air box is fitted. These kits protect the LPHW from freezing by closing the dampers to min when the ambient temperature is below 6°C. The first kit controls the machine dampers. A second kit controls the machine dampers and also a remote damper fitted by the customer in the installation ductwork.

All AW models are fitted with a fully controlled low pressure hot water air heating battery and a pool water heat exchanger.

Provision is made for an external heat source to be initiated by the 'SERIES 3 VARIHEAT' controller.

All AW models have air and water heat exchangers recovering energy from the refrigerated dehumidification process. These are also fully controlled with priority given to water.

## THE CALOREX 'SERIES 3 VARIHEAT' RANGE.

### FEATURES :-

All versions have removable drip trays for easy cleaning.

Control panel can be mounted remotely up to a maximum of 20 metre cable length.

Models fitted with a fresh air box or a negative pressure box have motor driven louvres on the exhaust and fresh air dampers.

Optional electrical resistance air heater boxes ranging from 6kW to 18kW.

The power to each model in the range is fed in via din rail mounted terminal blocks located in the electric box of the unit.

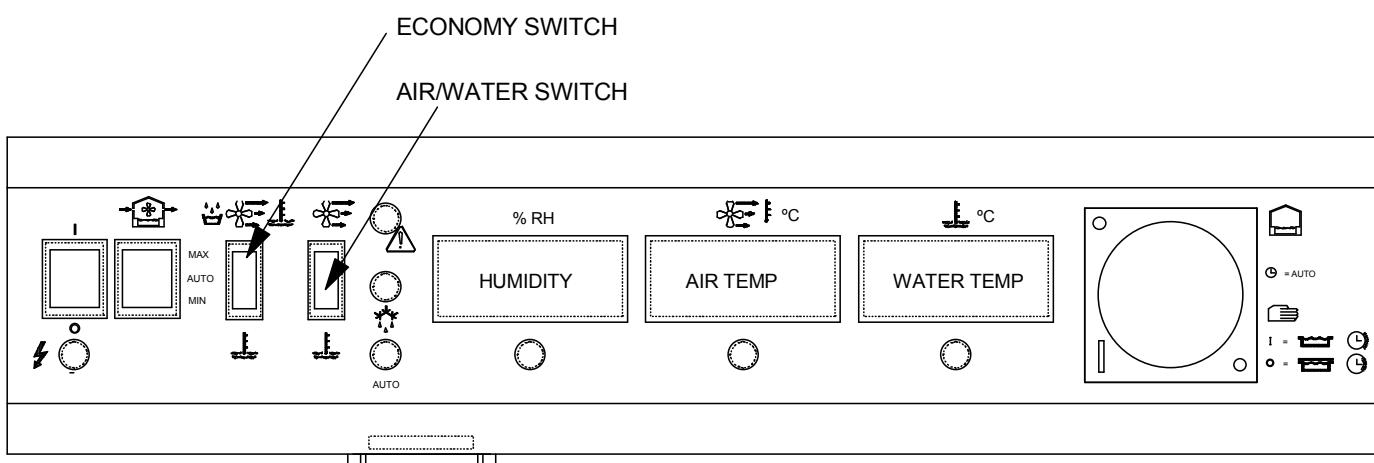

CONTROL PANEL. (All Models) Note AA Models do not have a water temperature controller, and do not include a time clock unless fitted with LPHW.

The panel has the following features,

1. Relative Humidity Controller, with red light to indicate dehumidification demand.
2. Air Temperature Controller, with red light to indicate air heating demand.
3. Water Temperature Controller, with red light to indicator water heating demand.
4. Fresh Air Switch, with MAX, AUTO and MIN positions (for use with fresh air module or negative pressure box).
5. Economy Switch to select between water heating only or full function on AW versions.
6. On/Off Switch. NOTE with the switch in the OFF position the machine is still live and mains lamp and clock are energised.
7. Air/Water switch, can be set to give priority to either water heating or air heating.
8. Time clock to control "occupied/unoccupied" timings with battery 'back up' and manual override.
9. Indicator lights :-

Power on  
Fault  
Defrost  
Auto  
Dehumidification  
Air heating  
Water heating (if applicable).

### CONTROL PANEL (AW version shown, see section 3.0)

## 1.1 OPERATION

When the SERIES 3 VARIHEAT is connected to the mains supply via an isolator and the isolator is energised, the MAINS light on the side of the electric box will illuminate indicating mains ON and time clock will start to run. The time clock has a battery reserve fitted which when charged will run for 100 hours so that isolating the machine for short periods will not affect the time clock settings.

The SERIES 3 VARIHEAT unit is switched on to normal operation by an ON (I)/OFF (O) switch on the control panel. When switched on the red indicator light will illuminate and digital controllers will light up. Note digital water controller will be the only controller to light up when in economy mode.

Providing that the controls are set to the correct parameters; nominally 60% RH, 28°C air temperature, 26°C water temperature and fresh air switch set to AUTO, then the machine will operate automatically. The 'unoccupied' temperature is set on the digital air controller and will be switched at the time set on the time clock.

As the unit operates, the indicator lights will show the state of the control conditions, ie dehumidification, heat to air and heat to water.

Other indicator lights are :-

Yellow for Fault (high or low refrigerant trip or soft start fault if fitted).

Yellow for Defrost

Green to indicate automatic operation.

See section 3.0 for control panel symbols.

## PARAMETER CONTROLLERS

Each parameter, Relative Humidity, Water Temperature and Air Temperature is sensed within the machine and the signal is taken to the relevant digital controller.

RH & Water Temperature controllers have two switching channels, also the Air Temperature controller for AA units without room heating:

OUT1 which is set from the front panel, OUT2 which is factory pre-set.

The Air Temperature digital controller for units with room heating has three switching channels, one of which is for setting OCCUPIED/UNOCCUPIED air temperature.

Each channel has a switching differential which is also factory pre-set. None of the factory settings should be tampered with.

When the re-settable channel is adjusted all other settings and differentials automatically follow at the correct relationship.

Nominal set point values & diff's	RH%	=	60%	diff 3%
	Air temperature	=	28°C	diff 0.5 °C
	Water temperature	=	26°C	diff 0.2 °C

Please note: on AA machines with no fresh air box or RCU, in occupied mode dehumidification stops once the Air temperature is 2.5°C above set point.

## TIME CLOCK

The time clock setting determines the OCCUPIED/UNOCCUPIED periods and is set to match the operators requirements regarding opening and closing times for the pool and possible times where the pool is covered. The two settings are OCCUPIED or day time, and UNOCCUPIED or night time (covered).

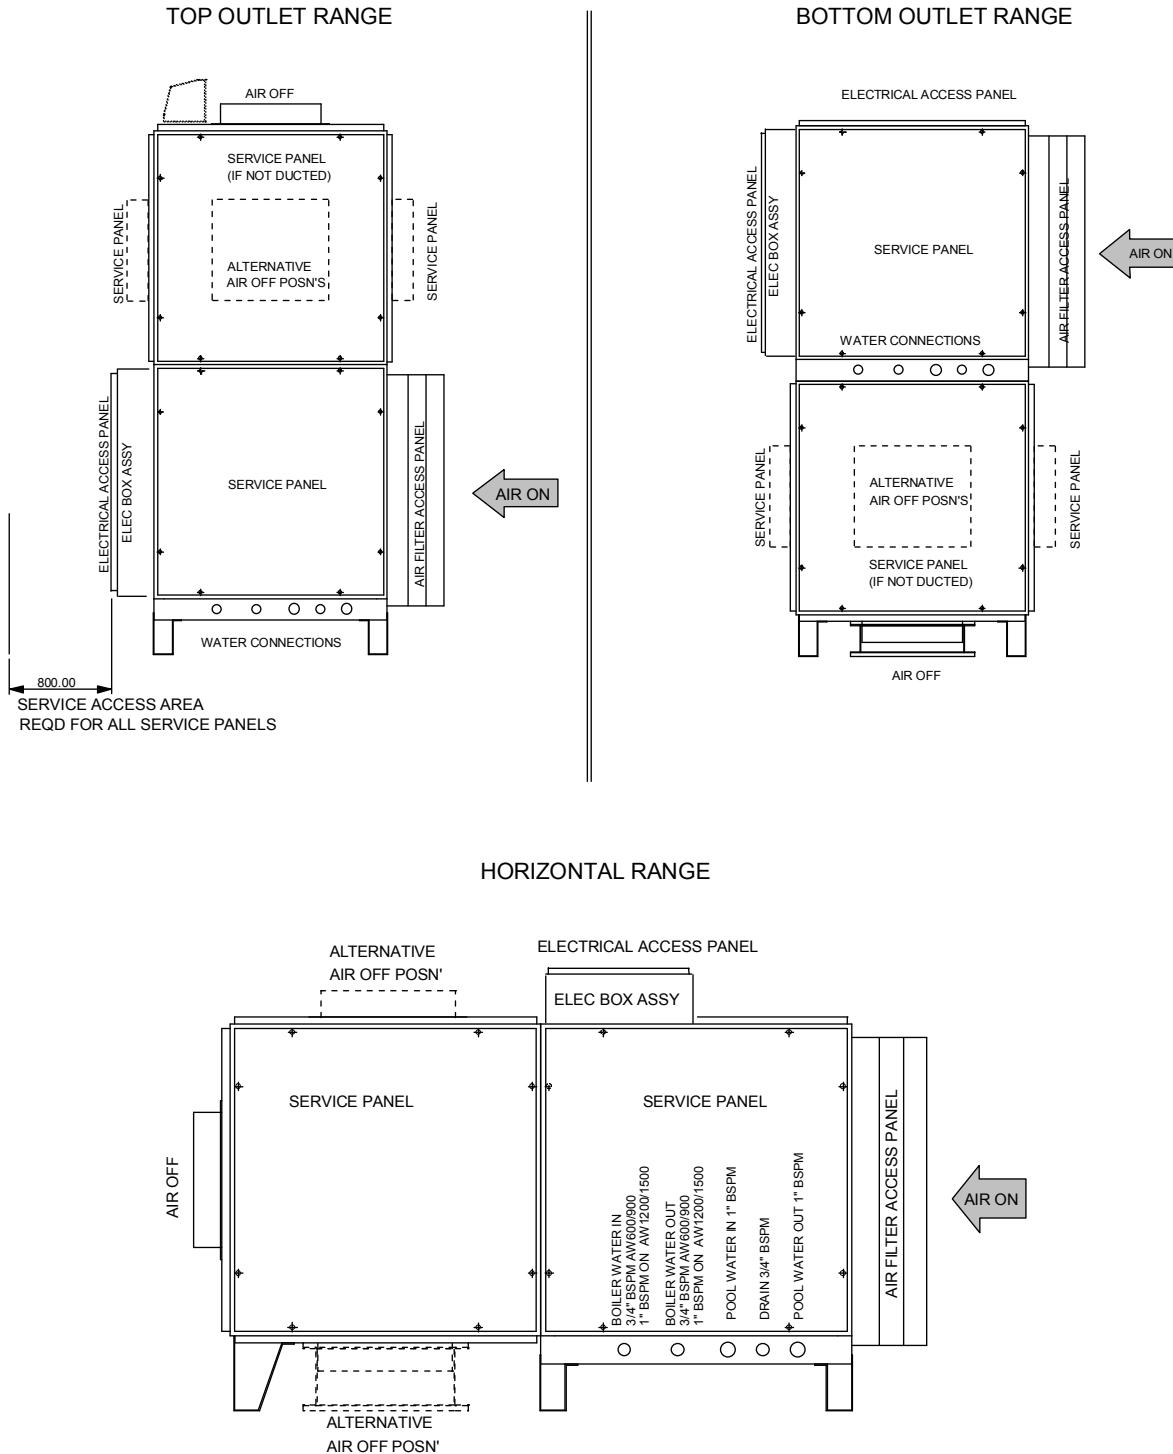

The most obvious action of this change is to lower the pool hall air temperature to a determined level to conserve air heating energy. This lowering of temperature is allowable because of the quiescent, and ideally covered, condition of the pool.

Pool water occupied      I =   (no pool cover)

Pool water unoccupied      O =   (pool covered)

## 2.0 INSTALLATION

### SITING, MACHINE LOCATION

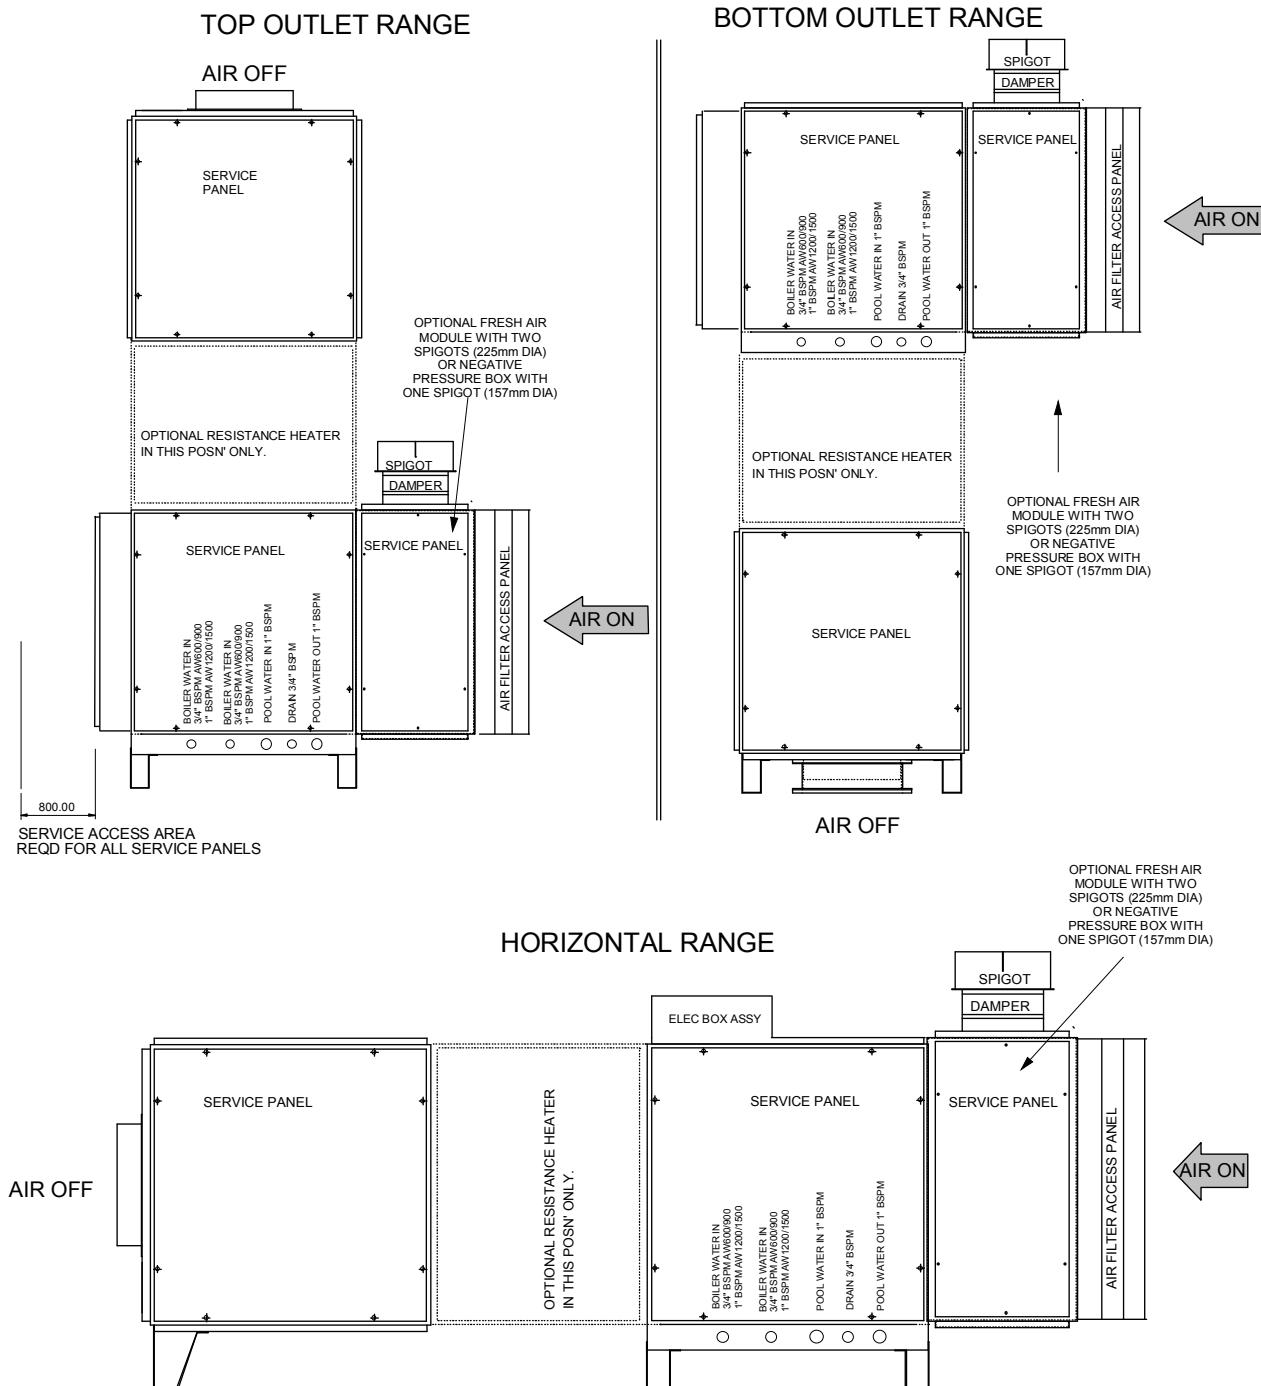

If unit is located in a plant room at pool hall air temperatures, any ambient air ducting must be heavily insulated. Recommend fresh air/exhaust spring return dampers to be fitted to ductwork for sub zero ambient applications in case of power failure.

**IMPORTANT - 600 and 900 models are fitted with constant flow fans and deliver the optimum airflow, self compensating for pressure differentials in the system.**

**On 1200 and 1500 models ensure duct work pressure drop does not exceed resistance given in data sheet. Damper plates fitted on side of fan CAN be removed if ducting is fitted but fan amps MUST be verified to be as per data sheet fan amps with dry coils, clean air filter and all panels fitted.**

## 2.0 INSTALLATION WITH OPTIONAL FEATURES

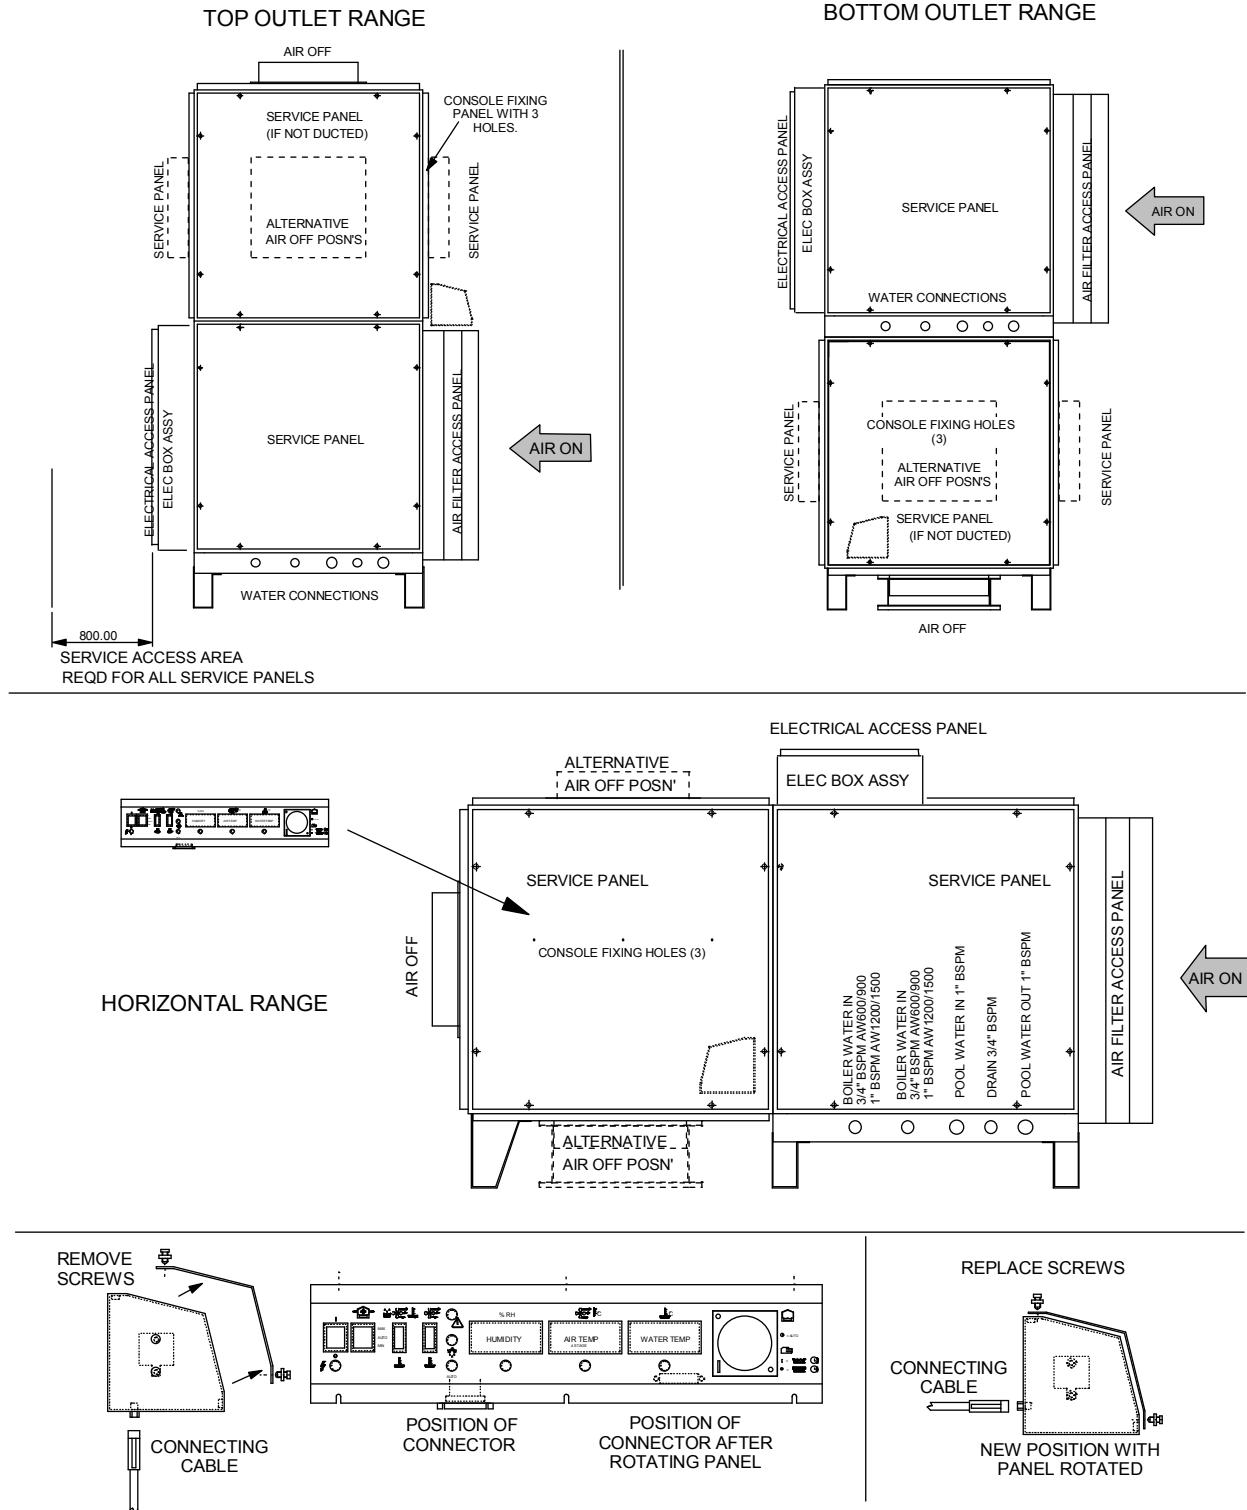

If unit is located in a plant room at pool hall air temperatures, any ambient air ducting must be heavily insulated. Recommend fresh air/exhaust spring return dampers to be fitted to ductwork for sub zero ambient applications in case of power failure.

**IMPORTANT - 600 and 900 models are fitted with constant flow fans and deliver the optimum airflow, self compensating for pressure differentials in the system.**

**On 1200 and 1500 models ensure duct work pressure drop does not exceed resistance given in data sheet. Damper plates fitted on side of fan CAN be removed if ducting is fitted but fan amps MUST be verified to be as per data sheet fan amps with dry coils, clean air filter and all panels fitted.**

## 2.0 CONSOLE FIXING

The Variheat 3 is designed with interchangeable service panels.

On delivery, a console fixing service panel is fixed in the position shown in the diagrams above. The console for the Variheat 3 will either be attached to the machine above the air filter access panel or located inside the Variheat 3 fan box. The console can be attached to the Variheat 3 as instructed below.

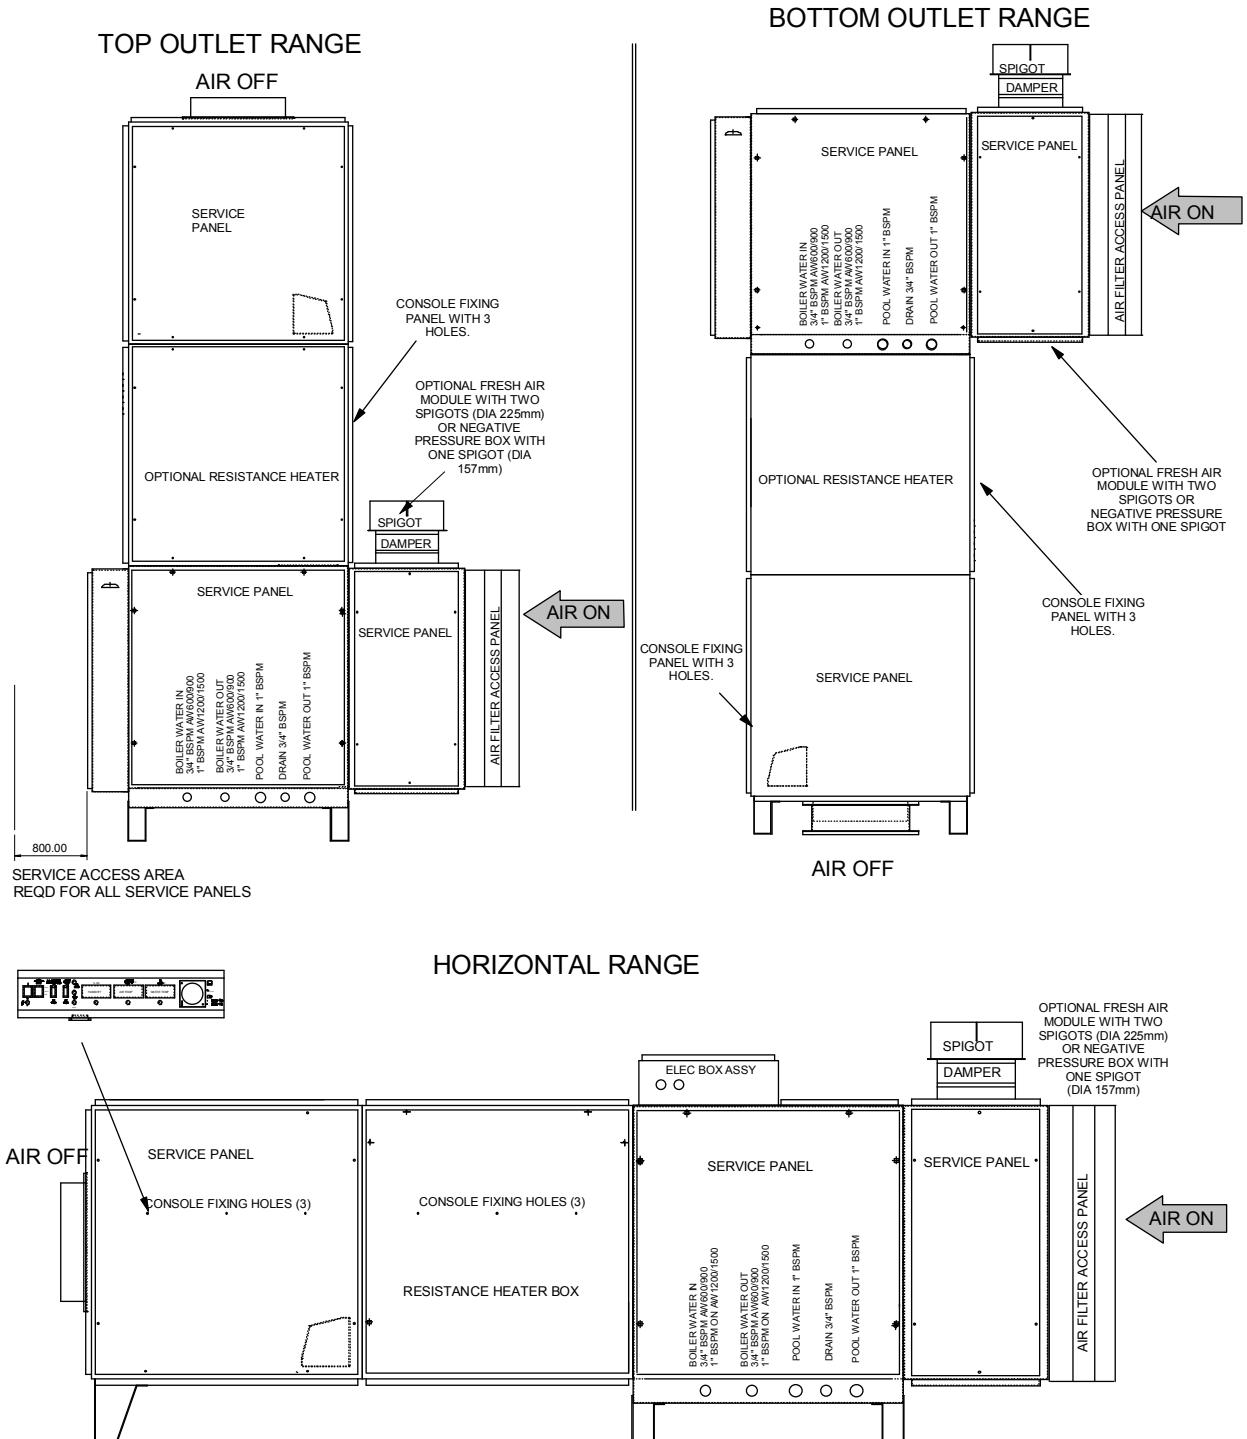

1. Fix the 3 self tapping screws provided into the 3 holes in the console fixing service panel. (Indicated by a label). Leave a small gap.

2. The console drops over the screws.

Note: It is best to have the console panel close to the electric box, as once the console is fixed to the Variheat 3 the ribbon cable connector supplied with the Variheat 3 needs to be connected between the console and the electric box. The connector on the console is at the bottom.

If the console is to sit on a shelf, the back panel on the console can be turned round. Remove the 6 fixings attaching the display to the back panel. Turn the panel round so that the connector points out of the back of the panel and replace the fixings. See sketch above.

## 2.0 CONSOLE FIXING, VARIHEAT 3 WITH OPTIONAL FEATURES

The Variheat 3 is designed with interchangeable service panels.

On delivery, two console fixing service panels are fitted in the positions shown in the diagrams above. The console for the Variheat 3 will be inside the Variheat 3 fan box. Attach the console to the Variheat 3 console fixing panel selected as instructed below.

1. Fix the 3 self tapping screws provided into the 3 holes in the console fixing service panel. (Indicated by a label). Leave a small gap.

2. The console drops over the screws.

Note: It is best to have the console panel close to the electric box, as once the console is fixed to the Variheat 3 the ribbon cable connector supplied with the Variheat 3 needs to be connected between the console and the electric box. The connector on the console is at the bottom.

See the sketch on the previous page for instructions on how to rotate the console back panel.

## **2.1 PLUMBING**

### **POOL WATER**

The Calorex 'SERIES 3 VARIHEAT' should be connected as shown in section 3.0.

If an existing heater is being retained then the 'VARIHEAT' should be connected between the filter and the existing heater.

Pool water connections on the machine are 1" BSPM stubs.

The unit is supplied with 2 off each of the following PVC fittings - 1"BSPFx 1" M

1" F x 1½" M

1½" x 50mm F

Suitable breakable couplings, isolation, and drain down valves should be installed in the pool water inlet/outlet pipes local to 'VARIHEAT' unit.

The heat exchanger in the 'VARIHEAT' unit will, on small pools, take the full flow rate of the recirculation system. On larger pools a bypass or separate auxiliary pump may be necessary. This method can also be used to reduce energy consumption, by the installation of a two speed or auxiliary pump by-passing the main pump/filter to satisfy pool water heating and dehumidification without the need for the main pump to be running.

When the pipework installation is complete the circulating pump should be switched on and the system checked for leaks. Also check the filter gauge to see that there is not excessive back pressure.

### **CONDENSATE DRAIN**

The condensate driptray in the 'VARIHEAT' unit collects the water removed by the dehumidification process, It is therefore necessary to ensure that the 'VARIHEAT' unit is placed on a level plinth so that the condensate can run away and not overflow the edges of the driptray inside the machine.

All 'SERIES 3 VARIHEATS' have a 3/4" BSPM threaded condensate drain connection. The drain pipe should run away with adequate fall to waste ie 1/2" per foot min. and must incorporate a 'U' trap & tun dish.

### **BOILER PLUMBING**

The boiler connections on the machine are :-

3/4"BSPM on AW600/900

1" BSPM on AW1200/1500

for connecting the boiler water flow and return.

Suitable breakable couplings, isolation, and drain down valves should be installed in the boiler water flow and return pipes local to the 'VARIHEAT' unit.

Water and air LPHW circuits internal to Calorex Heat Pump should be bled for air pockets. (Bleed valves fitted to unit).

Refer to the boiler manufacturers instructions before designing the pipework system.

### **IMPORTANT GENERAL CONDITIONS**

1. Do not route water pipes across service access panels or air inlet/outlets.
2. The water circuits to and from the 'VARIHEAT' unit should be capable of maintaining the specified water flow limits required by the machine.
3. All pipe work must be adequately supported with allowance for expansion and contraction especially with regard to the plastic pipe work.
4. It is recommended that when installing water systems the last connections to be made should be adjacent to the 'VARIHEAT' unit to avoid undue stresses on the unit connections.
5. All pool purifying devices and chemical injection systems must be fitted down stream of the 'VARIHEAT' unit with a non-return valve to prevent concentrated chemicals back feeding into the heat exchangers.
6. The practice of dosing chemicals direct into skimmer basket must not be allowed as this would result in concentrated corrosive liquids passing over vulnerable metal components.
7. Water quality must be maintained not only relating to solids, etc but for pH between 7.4 - 7.8, and if pool water is saline at a maximum concentration of 8mg/litre.
8. See Warranty Exclusions section 6.0 for total list of water quality limits.

## 2.2 DETERMINING WATER FLOW

### Flow Meter Method (see pool water schematics)

Ensure isolation valves 'A' and 'B' and bypass valve 'C' are fully open. Slowly close down bypass valve 'C' until correct flow rate is shown on the flow meter (see section 4.0).

Remove handle and lock off valve 'C'.

### Differential Pressure Method

By simply installing two filter pressure indicating gauges, one on the inlet and one on the outlet of the heat pump, and a locking type gate bypass valve in the bypass line, the flow rate through the heat pump can be accurately determined by the difference in the readings of the gauges. This pressure drop is proportional to flow.

Flow rate should be set at the maximum differential with a clean filter fitted, this differential pressure will drop as the filter becomes dirty. Provided the filter is cleaned before the minimum differential is reached then no problems should be encountered (standard system only)

### Setting up the differential

When the installation is complete, the procedure for setting the flow rate through the heat pump using two gauges is as follows :-

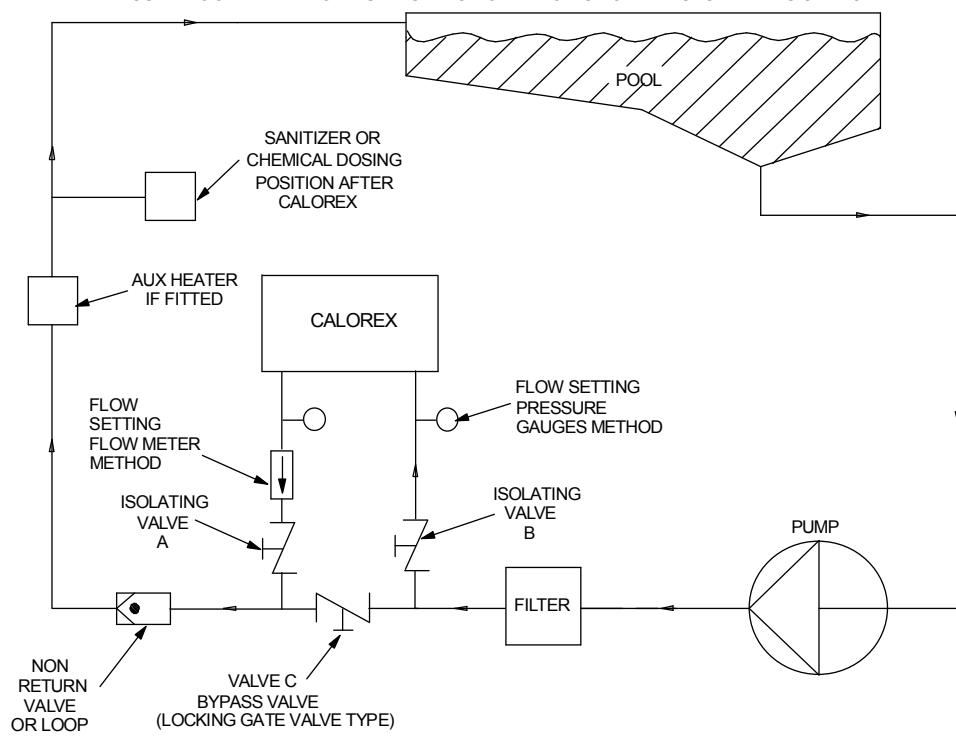

1. With the heat pump switched off, ensure isolation valves 'A', 'B' and bypass valve 'C' are fully open.
2. Switch on water circulating pump.
3. Note the water system pressure on both gauges - they should read the same, but because of manufacturing tolerance they may read different.

For example :- with a water system pressure of 5mhd the gauge on the inlet may read 5 and the outlet gauge 5.5 therefore there is a static error difference of 0.5mhd.

4. Gradually close the bypass valve 'C' until there is a difference in pressure between the two gauges that is equal to the required pressure drop (see section 4.0) observing any static error on the gauges before beginning this process.
5. Lock the bypass valve, or render it tamper proof when correct setting is achieved.
6. See section 4.0 for correct pool water pressure drop.

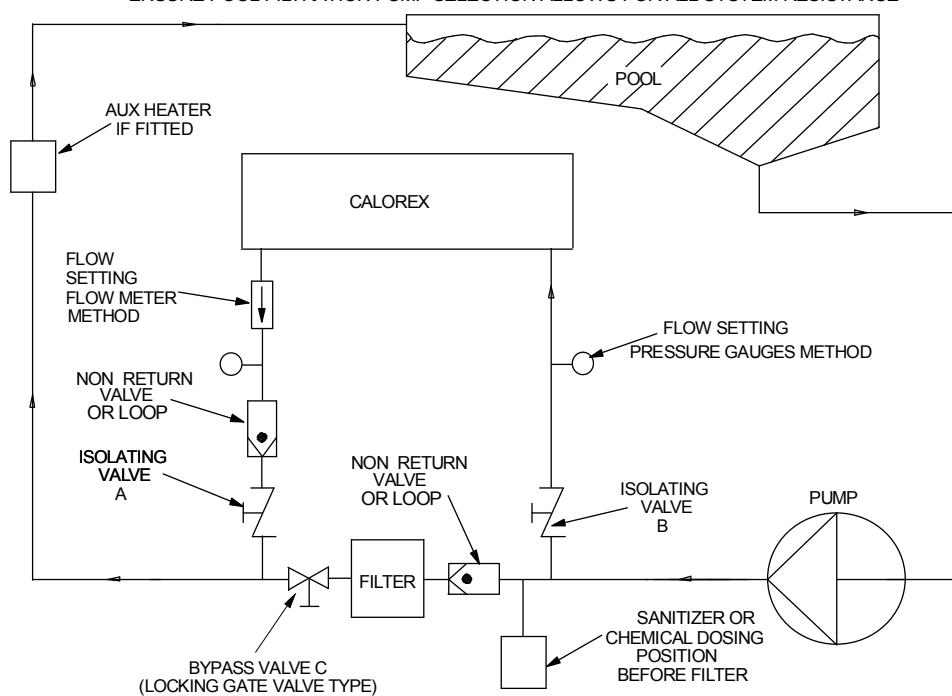

## POOL WATER SCHEMATIC (STANDARD)

ENSURE POOL FILTRATION PUMP SELECTION ALLOWS FOR ALL SYSTEM RESISTANCE

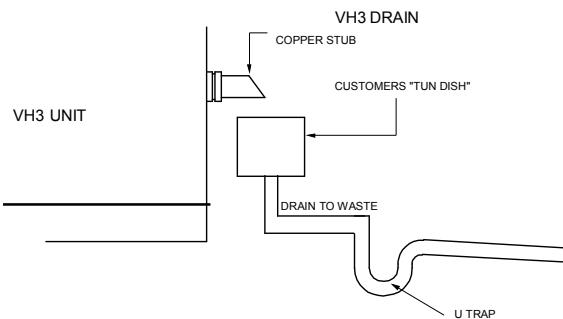

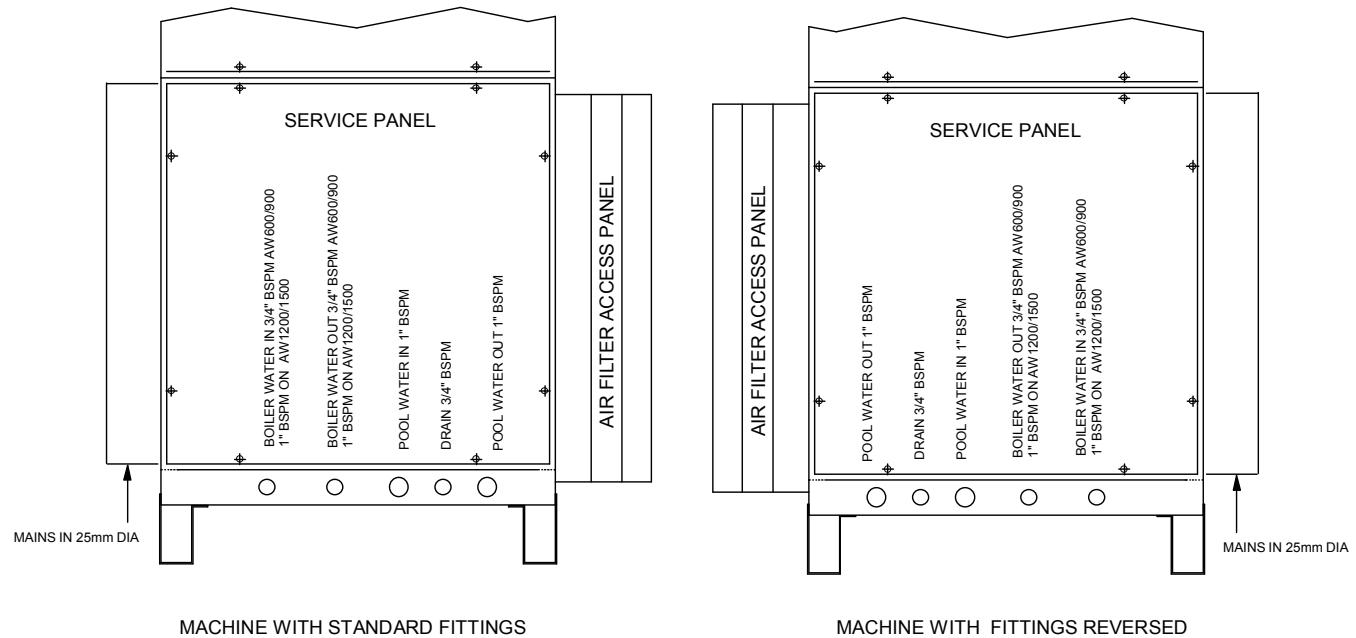

## POOL WATER SCHEMATIC (FILTER DOSING)

ENSURE POOL FILTRATION PUMP SELECTION ALLOWS FOR ALL SYSTEM RESISTANCE

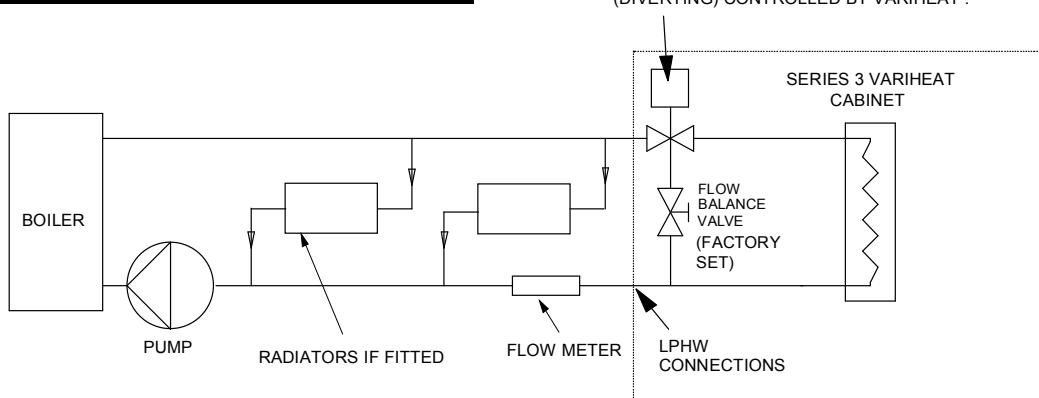

## 2.3 WATER CONNECTIONS

(also see SECTION 2.1)

### BOILER WATER SCHEMATIC

## **2.4 ELECTROLYTIC CORROSION IN SWIMMING POOLS**

Electrolytic corrosion will occur when dissimilar metals that are in contact with each other create a potential difference between themselves. Sometimes separated by a conductive substance known as an electrolyte, the dissimilar metals will create a small voltage (potential difference) that allows the ions of one material to pass to the other. Just like a battery, ions will pass from the most positive material to the more negative material.

Anything more than 0.3 volts can cause the most positive material to degrade.

A swimming pool with its associated equipment can create this effect. The pool water being an ideal electrolyte and components of the filtration circuit, heating system, steps, lights etc providing the dissimilar metals needed to complete the circuit.

Whilst these small voltages are rarely a safety threat, they can create premature failure through corrosion. Not dissimilar to corrosion through oxidation, electrolytic corrosion can cause complete failure of a metallic material in a very short period of time.

In order to prevent this type of corrosion all metallic components in contact with swimming pool water should be bonded together using 10mm<sup>2</sup> bonding cable. This includes non-electrical items such as metal filters, pump strainer boxes, heat exchangers, steps and handrails. It is highly recommended that bonding be retrofitted to existing pools, which may not be protected by this system.

## 2.5 ELECTRICAL INSTALLATION

### ELECTRICAL SAFETY

It is important to ensure that all aspects of the installation comply with the latest I.E.E. Regulations. It is also important to ensure that any remote devices which terminate within the pool hall are of the type and voltage as specified in the latest I.E.E. Regulations.

The machine should be installed in accordance with EMC2004/108/EC.

### PROTECTED SUPPLY

Whilst not mandatory, Calorex recommend that an R.C.C.B. is always fitted or that the supply is to local electricity authority recommendations, and that all ducting is bonded in accordance with these regulations. The supply to the machine should incorporate fuses or motor rated circuit breakers (type GU, FAZC) to specified rating (see data sheet) H.R.C. fuses are recommended. An isolator must be fitted within clear view of the machine and not more than 2 metres away. The isolator must have a minimum of 3mm air gap when in the off position.

### INCONSISTENT ELECTRICAL SUPPLY.

The following limits of operation must not be exceeded if Calorex machines are to be guaranteed either in performance or warranty terms :-

Voltage single phase -	207V min, 253V max
Voltage three phase -	360V min, 440V max
Frequency -	47.5Hz min, 52.5Hz max.

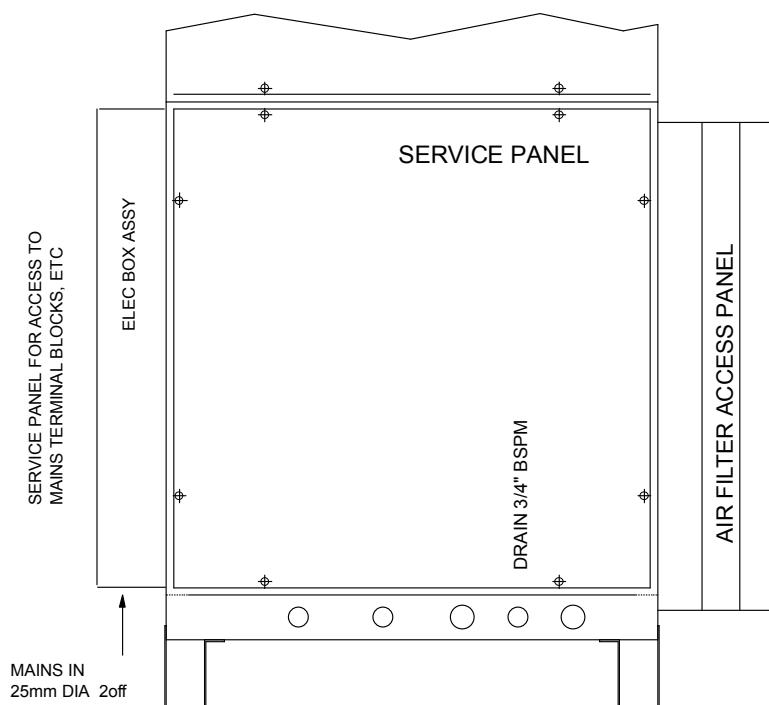

**N.B** The voltage must be measured at the heat pump mains terminals with all the fans/compressors running at the rated condition.

Please note that AW1200/1500 three phase machines are fitted with a phase rotation relay and will not run if the phases are connected incorrectly or if the voltage is 15% less than 400V (340V) for a three phase 50Hz machine

### CORRECT CABLE SIZING

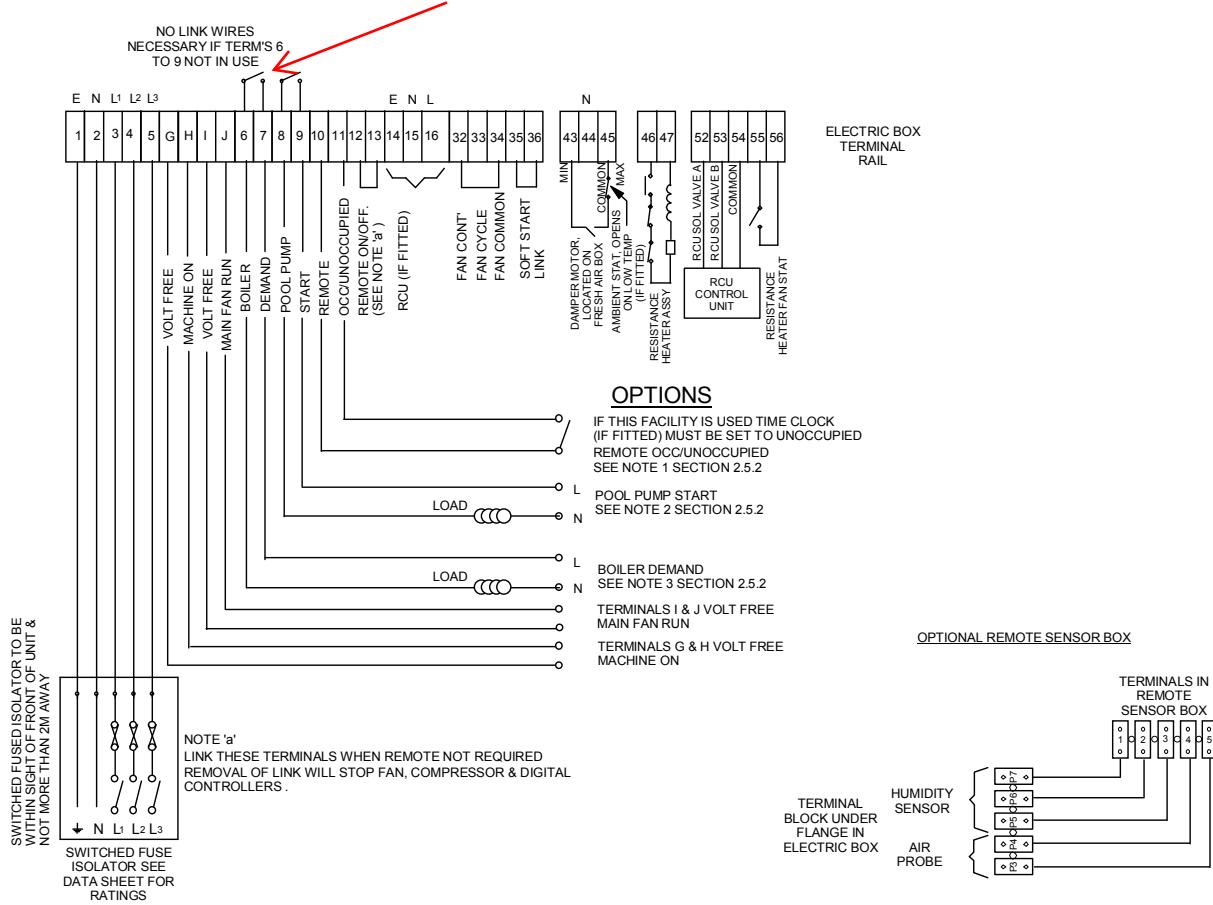

The cable supplying electricity to a machine with a given load must increase in cross sectional area (CSA) as the length increases in order that the voltage drop within the cable does not exceed recommended limits. Cable sizing should be calculated by an approved electrician with due consideration to I.E.E. and local codes of practice.

If resistance heaters are fitted an extra power supply will be required to the terminal blocks inside the heater box, see data sheet for supply amps and fuse size.

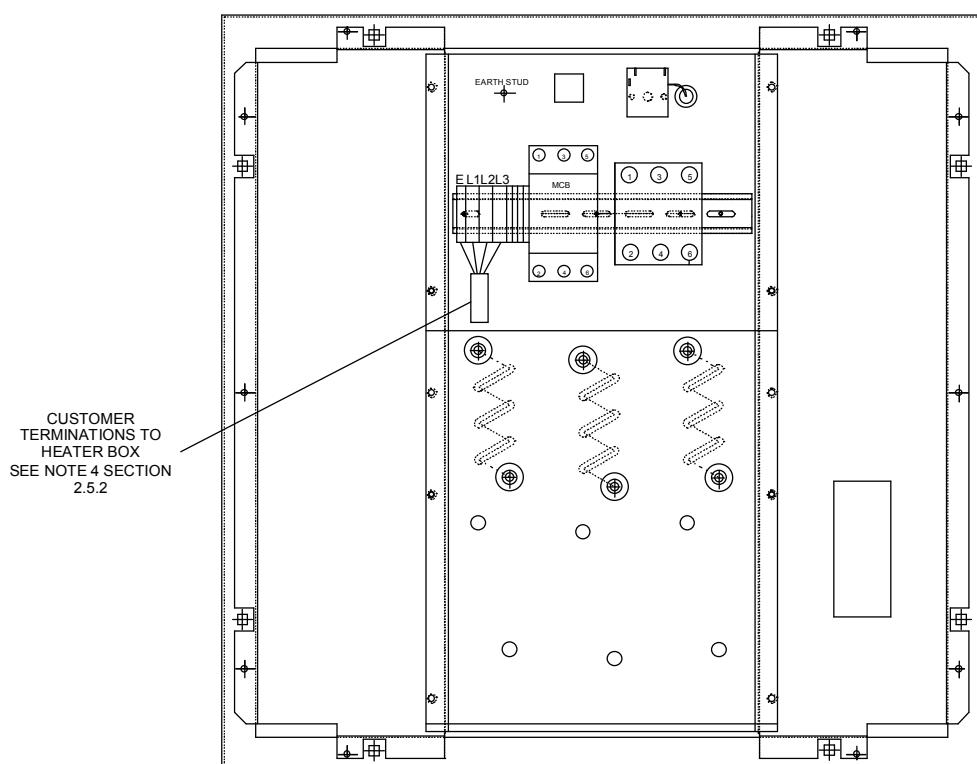

## 2.5.1

### MAINS SUPPLY TERMINAL BLOCK LAYOUT SINGLE AND THREE PHASE (NO CONNECTION TO TERMINALS 4 AND 5 ON SINGLE PHASE UNITS)

### SEPARATE MAINS SUPPLY TERMINAL BLOCKS FOR RESISTANCE HEATER BOXES LAYOUT SINGLE AND THREE PHASE (NO CONNECTION TO TERMINALS L2 AND L3 ON SINGLE PHASE UNITS)

## **2.5.2 NOTES ON TERMINAL BLOCK CONNECTIONS**

### **NOTE 1 - Remote occupied/unoccupied**

These contacts (from terminals 10 & 11) are to enable the air temperature set back facility to be remotely overridden. Please note that in unoccupied mode on AW machines, water heating does not take place unless there is a demand for dehumidification.

There is a 12 Vac output from these terminals and closing a remote switch will enable the unit to regain the normal operating air temperature for when the pool is in use.

This can be done via a voltage free pool cover switch or some other form of voltage free switch.

If this facility is used then the time clock (if fitted) on the control panel of the unit should be set to the 'unoccupied' (o) position. (See note on time clock and switch settings, section 3.2.1).

If these terminals are fitted on versions without time clocks then they MUST BE LINKED.

### **NOTE 2 - Pool pump start -AW only (see also section 3.2.2)**

These are voltage free contacts (from terminals 8 & 9) rated at 3(1) Amp at 230 Volts.

If the pool water pump is to be run via an external time clock then these connections should go across the switching contacts of the external time clock to ensure that, if dehumidification demand occurs the pool water pump will start.

The pool water pump will exceed the one amp inductive rated current of these contacts therefore a contactor or relay should be used to switch the load of the pump. The switching action of the external time clock should energise the contactor/relay coil.

If the pool water pump is to be run continuously then these contacts can be ignored.

### **NOTE 3 - Boiler demand -AA+LPHW & AW machines only**

These are voltage free contacts (from terminals 6 & 7) rated at 3(1) Amp at 230 Volts.

If the low pressure hot water supply to the unit is to be governed by the Calorex unit then these contacts should be utilised to bring water to the unit via the boiler, motorised valve, boiler pump etc. Remember the maximum inductive load is one amp.

This is dependant on how the low pressure hot water supply to the unit has been designed.

If the supply of low pressure hot water to the unit is not dependant on a signal from the unit then these contacts can be ignored.

### **NOTE 4 – SEPARATE SUPPLY FOR RESISTANCE HEATER BOX**

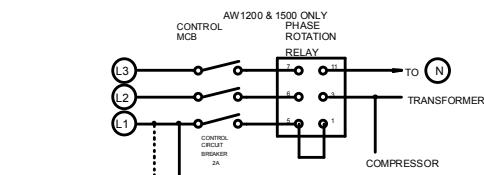

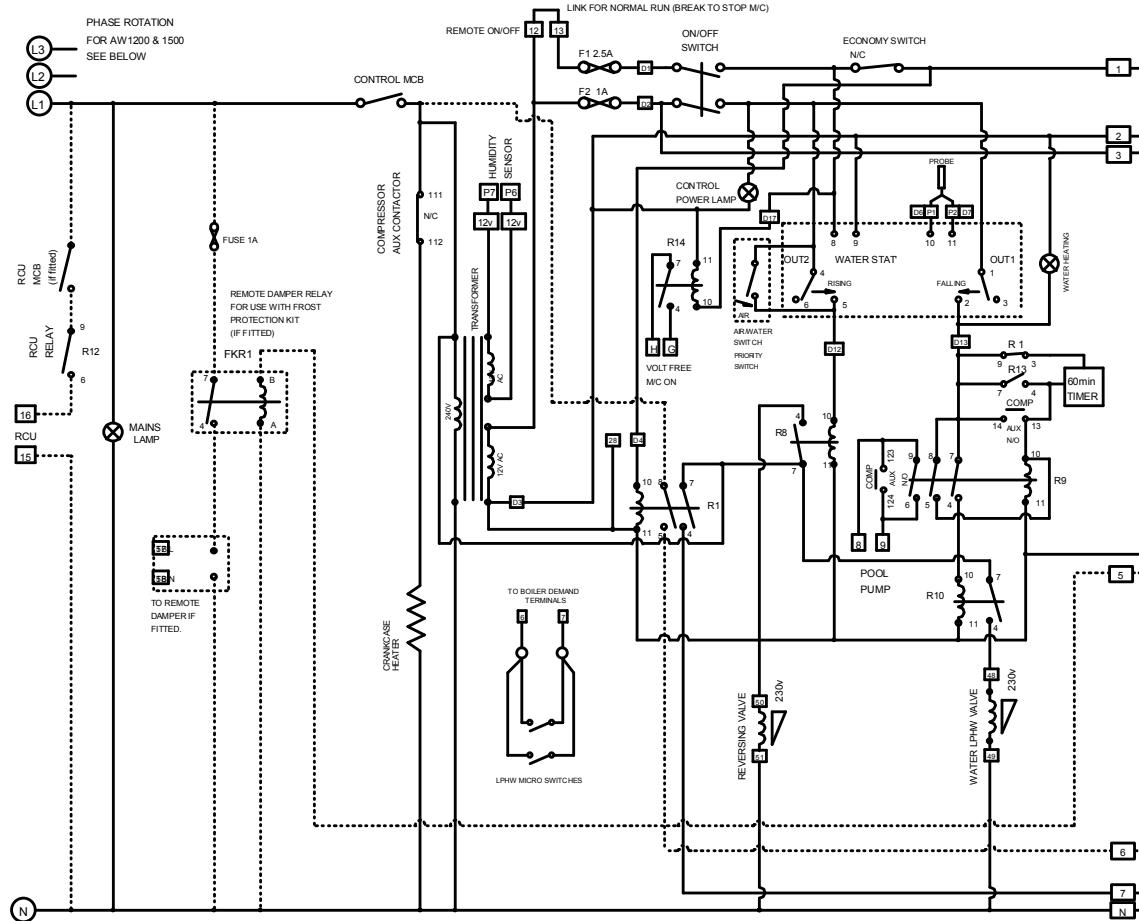

If resistance heaters are fitted then an extra power supply will be required to the terminal blocks inside the heater box. See section 4.0 for supply amps & fuse size.

### **CONTROL PANEL 25 WAY CABLE CONNECTION**

Data signal between control panel and electric box is via a 25 way cable with 'D' connection (plug & socket) both ends.

## **2.7 REGULAR PLANNED MAINTENANCE**

Operations to be carried out during a regular planned maintenance visit are as follows:

1. Replace all belts where fitted.
  2. Clean or replace filters as applicable. (This action may be required more frequently than regular servicing.)
  3. Check operation and condition of all fans and compressors.
  4. Check capacitor tolerances (where fitted).
  5. Check condition of all heat exchangers/evaporators.
  6. Check refrigeration system parameters.
  7. Check operation of control valves.
  8. Check for water leaks.
  9. Check drip trays and internal drain lines for blockages and clear.
  10. Check operation of controls and calibrate as necessary.
  11. Check operation of interlocks in use.
  12. Final check on overall operation of unit.
  13. Indicate on report any faults found or causes for concern.

### 3.0 CONTROLS

#### STANDARD CONTROL PANEL MODULE (12V)

see note a below

- | Power on
- Power off
- Power symbol
- Fresh air flow Switch (for fresh air/negative pressure box options only)-  
- in AUTO position auto indicator light will be on.  
- in MAX position dampers fully open, light off.  
- in MIN position dampers closed, light off.
- Fault light Check that the pool hall air and water flow through the unit are within specified limits. Check M.C.B.'s & pressure switches see note b (also soft start overload if fitted) and push all to reset. Call for a service check if fault light stays on.
- Defrost light Unit is temporarily defrosting evaporator machine will automatically reset.
- Dehumidification light Indicates that there is a demand for the unit to dehumidify.
- Air heating light Indicates that there is a demand for the unit to heat the pool hall air.
- Water heating light Indicates that there is a demand for the unit to heat the pool water.
- Pool hall symbol
- Manual override symbol
- I = Pool water occupied (no pool cover)
- O = Pool water unoccupied symbol (pool covered)

Economy Switch (AW versions only). Switches between full function, i.e. dehumidification/air & water heating to water heating only. Note that in economy mode there is a 60 minute time delay before water heating commences.

Air to Water Switch (AW versions only). Can be set to give priority to either water heating or air heating.

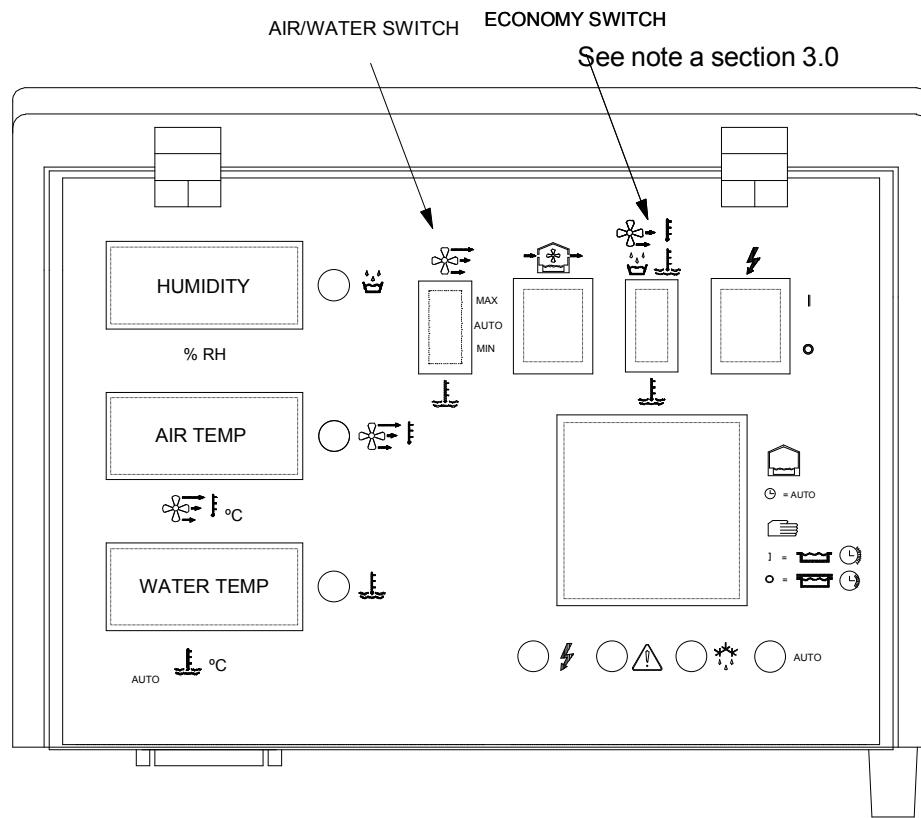

Note 'a'

Water temperature display and Economy switch not fitted on 'AA' or 'AA+LPHW' versions, time clock not fitted on 'AA' version.

Note 'b'

High & low pressure switches are mounted on a cross bracket fitted inside the fridge box assemblies. Push the red button on each switch to reset.

## OPTIONAL REMOTE CONTROL PANEL MODULE (12V)

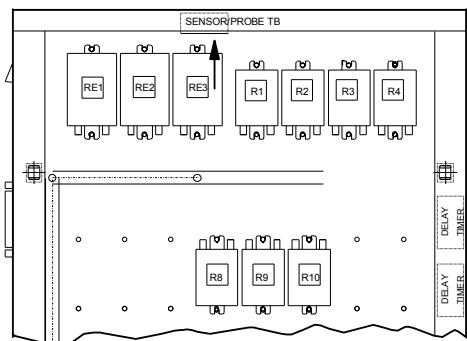

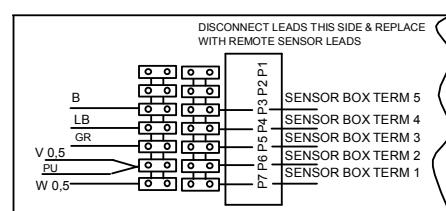

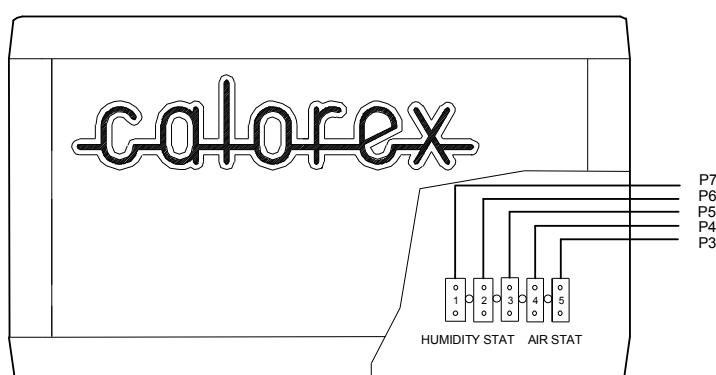

Note - water sensor lead can be extended up to 20 metres with 0,5mm<sup>2</sup> cable.

Also on sensor lead terminal block (located in electric box assy) terminals P5 & P7 must be linked for this control panel to operate.

## OPTIONAL REMOTE SENSOR BOX

Disconnect wires to sensors at electric box terminals & run leads to sensor box & connect as shown  
use 0,5mm<sup>2</sup> cable up to 20 metres.

SENSOR PLUG AND TERMINAL BLOCK

ELECTRIC BOX

### 3.1 COMMISSIONING CHECKLIST

- a. Is the building finished in accordance with the original plans and specification.
- b. Is the plenum chamber and all ductwork insulated, special attention should be made to the insulation of the exhaust air ducting and fresh air inlet ducting to prevent condensation problems.
- c. Are there any significant draughts in the pool hall or plant room (plenum installation) through poorly fitting doors, windows, pipe ducts, etc. This will let in unwanted ambient air raising the heating duty required.
- d. Is fresh air suction and exhaust air discharge ducting (if fitted) perfectly sealed from plant room.

NOTE: (c) and (d) above should be checked by measuring plant room and pool hall air temperatures. If the plant room is acting as a plenum chamber both temperatures should correspond. If the plant room temperature is lower than ambient air is leaking in, this leak should be located and rectified.

- e. Are the fresh air inlet and exhaust air outlets free from obstructions ie, undersize grilles, objects in the path of exhaust air deflecting it back to the fresh air inlet, etc.
- f. Is 'occupied / unoccupied' set correctly, (set with air thermostat) see section 3.2.3.
- g. Is the time clock set correctly.
- h. Is start up ('fresh air flow' switch to 'min') feature required and if so is customer aware of when to switch machine back to 'Auto'.
- i. Has the Calorex Heat Pump been bled for air pockets. (Bleed valves fitted to unit as standard).
- j. Any sign of abnormal operation such as water dripping should be reported immediately to an installer or Calorex.
- k. Is airflow sufficient through machine? Remove fan damper plates and check fan amps.
- l. Check belts and filters are fitted correctly.

#### 3.2.1 TIME CLOCK SETTINGS

The time clock is a quartz 24 hour clock with 100 hours battery reserve used to control the automatic operation of the SERIES 3 VARIHEAT unit per 24 hour time cycles.

##### SETTING ACTUAL TIME

Turn the large clock hand clockwise until the correct time of day is set, ensuring that the correct half of the day is chosen (24 hour clock).

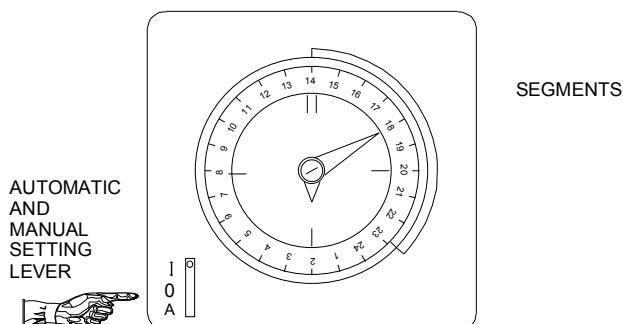

FIG 1.

##### SETTING FOR AUTOMATIC OCCUPIED/UNOCCUPIED OPERATION WITH TIME CLOCK

To set for automatic time clock control of occupied/unoccupied, slide the lever to 'A'. Each yellow segment represents a 15 minute time period. Extend outward the segments for a period of time that the pool is occupied (i.e. used or uncovered) per day.

If the unoccupied period is more than 20 hours per day, extend one segment at 9:00 or other suitable time that does not coincide with the main occupied period\*.

## SETTING FOR AUTOMATIC OCCUPIED/UNOCCUPIED OPERATION WITH REMOTE INTERFACE

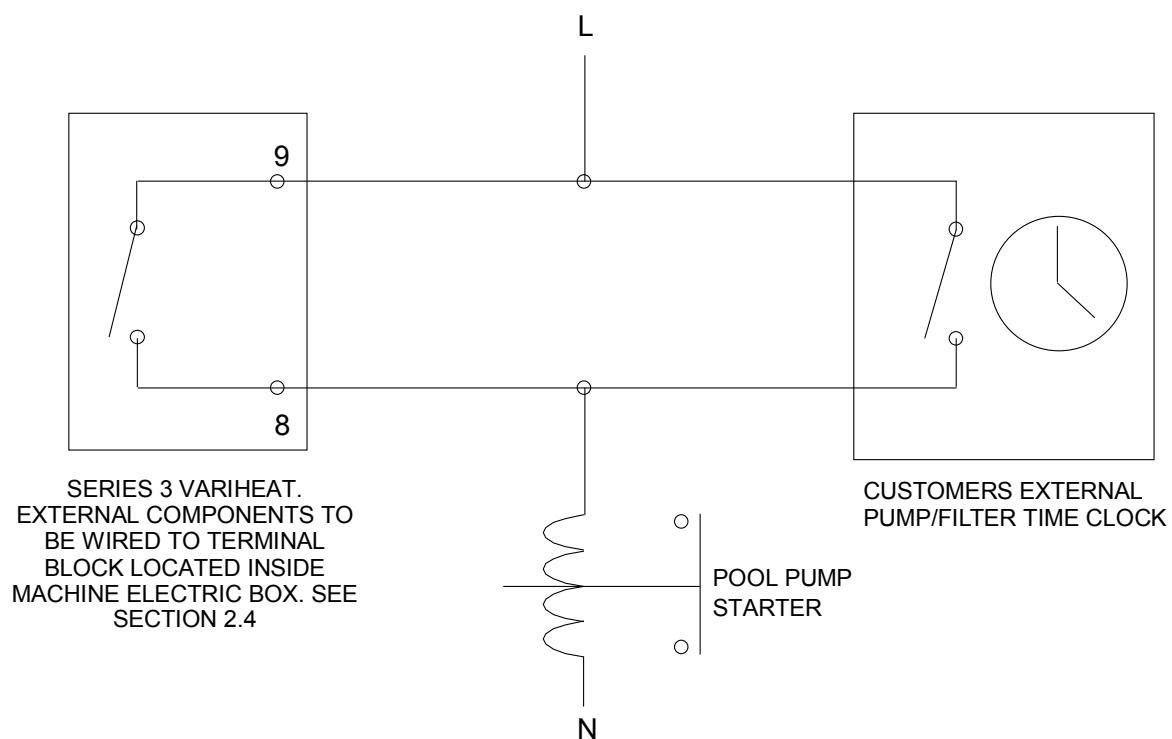

To set for remote control of occupied/unoccupied, slide lever to 'O'. See section 2.4, Note 1 for more information on remote interface. If the unoccupied period is more than 20 hours per day, extend one segment at 9:00 or other suitable time that does not coincide with the main occupied period.\* Ensure all other segments are pushed inwards and slide lever to 'A'.

## SETTING FOR MANUAL OCCUPIED/UNOCCUPIED OPERATION

To set for manual occupied period (or override automatic unoccupied period) slide the lever to 'I' for 'occupied'. If the unoccupied period is more than 20 hour per day, to set for a manual unoccupied period slide the lever to 'O' for 'unoccupied'; extend outwards one segment at 9:00 or other suitable time that does not coincide with the main occupied period\* and ensure all other segments are pushed inwards.

\*In unoccupied mode, the pool water is not heated unless a demand for dehumidification occurs during this period. If the unoccupied is more than 20 hours per day, it is recommended to allow a brief occupied period to allow the water temperature to be sampled and maintained if necessary.

## 3.2.2 WIRING TO EXTERNAL SWIMMING POOL PUMP/FILTER TIME CLOCK

### **3.2.3 POOL & AIR TEMPERATURE AND HUMIDITY CONTROLS**

#### **POOL WATER TEMPERATURE & HUMIDITY DIGITAL CONTROLLERS AND AIR DIGITAL CONTROLLER ON AA MACHINE WITHOUT AIR HEATING**

To Program the Set Point. Press down P, SP1 and Set Point value will be displayed alternately. Press the  $\Delta$  or  $\nabla$  key to change the value of SP1. Once the desired value is displayed press P to memorise the value. The display will revert to the present reading.

NOTE: If anything else shows on the display leave alone for 1 minute until the display returns to normal.

#### **AIR TEMPERATURE DIGITAL CONTROLLER AW AND AA MACHINES WITH AIR HEATING**

The digital controller for controlling air temperature can be changed as follows:-

To program the set point, press P button once and release it. SP1 (set point) and set point value e.g. 28 will be displayed alternately. Press P again AL1 (-4.5) will show. This is the difference between the set point and AL1 plus a constant 0.5 e.g. 28 - 4.5 + 0.5 = 24°C (unoccupied) SP1 and AL1 can be changed in the same way as described for humidity and air.

NOTE: AL1 can only be set -1 to -10 below SP1 value.

If the reading on the digital controller is not the same as the actual pool hall temperature, water temperature or relative humidity it may be necessary to program an offset into the digital controller. See technical manual.

#### **FRESH AIR BOX**

**AUTO** Opens dampers and switches on fan when demand for dehumidification (OUT 2) and/or high temperature OUT 3 (**OUT 2 on AA version without time clock**). Machine must be in occupied mode to close Relay 4 and to bring on fan and open damper motor.

**MAX** Opens dampers and brings on fresh air fan to provide full fresh air at all times, even in unoccupied mode.

**MIN** Turns off fresh air fan and closes dampers to minimum position.

**NOTE** On machines with LPHW, if the optional frost protection stat is fitted, the operation of the dampers will be inhibited when the ambient temperature is below 6°C.

#### **NEGATIVE PRESSURE BOX**

**AUTO** Opens dampers and switches on fan when demand for dehumidification (OUT 2) and/or high temperature OUT 3 (**OUT 2 on AA version without time clock**). Machine must be in occupied mode to close Relay 4 and to bring on fan and open damper motor.

**MAX** Opens dampers to exhaust air from pool hall at all times, even in unoccupied mode.

**MIN** Turns off fresh air fan and closes dampers to minimum position.

**NOTE** On machines with LPHW, if the optional frost protection stat is fitted, the operation of the dampers will be inhibited when the ambient temperature is below 6°C.

## 4.0 DATA SHEET

### SERIES 3 VARIHEAT

MODEL:-		Units	AA/AW600	AA/AW900	AA/AW1200	AA/AW1500
DEHUMIDIFICATION DUTY	VIA HEAT PUMP (30°C/60% rh)	litres/hr	4.6	6.5	8.5	10.1
	TOTAL @ 18°C dewpoint (summer if fresh air option fitted)	litres/hr	5.2	7.3	9.5	11.3
	TOTAL @ 7°C dewpoint (winter if fresh air option fitted)	litres/hr	6.5	9.0	11.7	13.9

## **6.0 WARRANTY CONDITIONS**

The following exclusions apply to the Warranty given by Calorex Heat Pumps Ltd. No claims will be accepted if :-

- 1.The heat pump is incorrectly sized for the application.
- 2.The heat pump is installed in any way that is not in accordance with the current procedures as defined by Calorex Heat Pumps Ltd.
- 3.The heat pump has been worked upon or is adjusted by anyone other than a person authorised to do so by Calorex Heat Pumps Ltd.
- 4.The air flow to and from the machine is outside the specified limits.
- 5.The water flow through the machine is outside the specified limits.
- 6.The water pH level and/or chemical balance is outside the following limits:-

Acidity pH	pH	7.2 - 7.8
Total Alkalinity, as CaCO <sub>3</sub>	ppm	80 - 120
Total Hardness, as CaCO <sub>3</sub>	ppm	150 - 250
Total Dissolved Solids	ppm	1000
Maximum Salt Content	ppm	8000
Free Chlorine Range	ppm	1 - 2 Domestic
Free Chlorine Range	ppm	3 - 6 Commercial
Superchlorination	max	30ppm for 24 hrs
Bromine	ppm	2 - 5
Baquacil	ppm	25 - 50
Ozone	ppm	0.9 Max
Maximum Copper Content	ppm	1
Aquamatic Ionic Purifier	ppm	2 Max

- 7.The heat pump has suffered frost damage.
- 8.The electrical supply is insufficient or in any way incorrect.
- 9.The fan amps and duct pressure are outside the specified limits.
10. The heat pump must be maintained to the service requirements in section 2.7.

For details of extended warranty and maintenance packages please call the service number below.

### **IF IN ANY DOUBT PLEASE ASK**

Note:- The Reply Paid Warranty Registration Card must be returned, to ensure that the correct warranty is given. If you do not find a Registration Card with your Heat Pump please contact the Calorex Service Department giving your name, address, model & serial number of your heat pump. A card will be sent to you for completion.

Email [service@calorex.com](mailto:service@calorex.com)

01621 856611

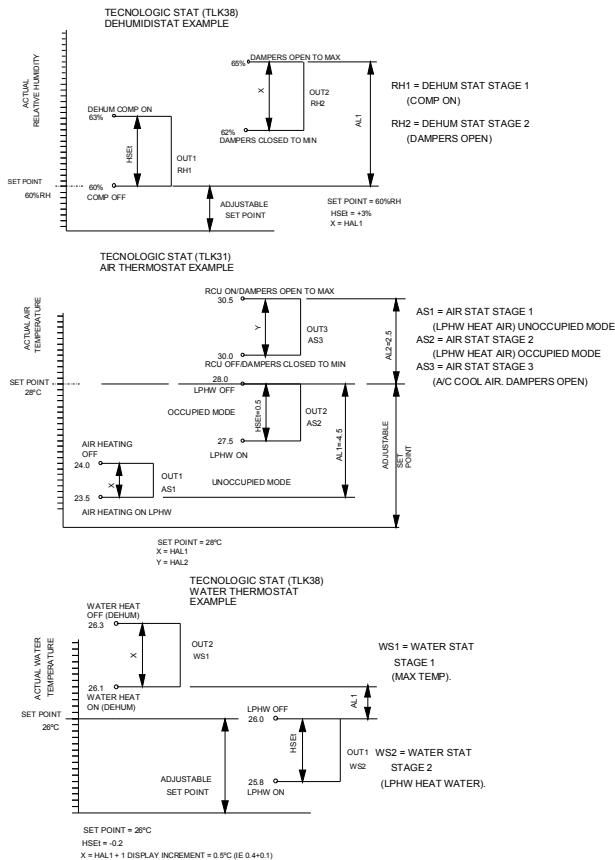

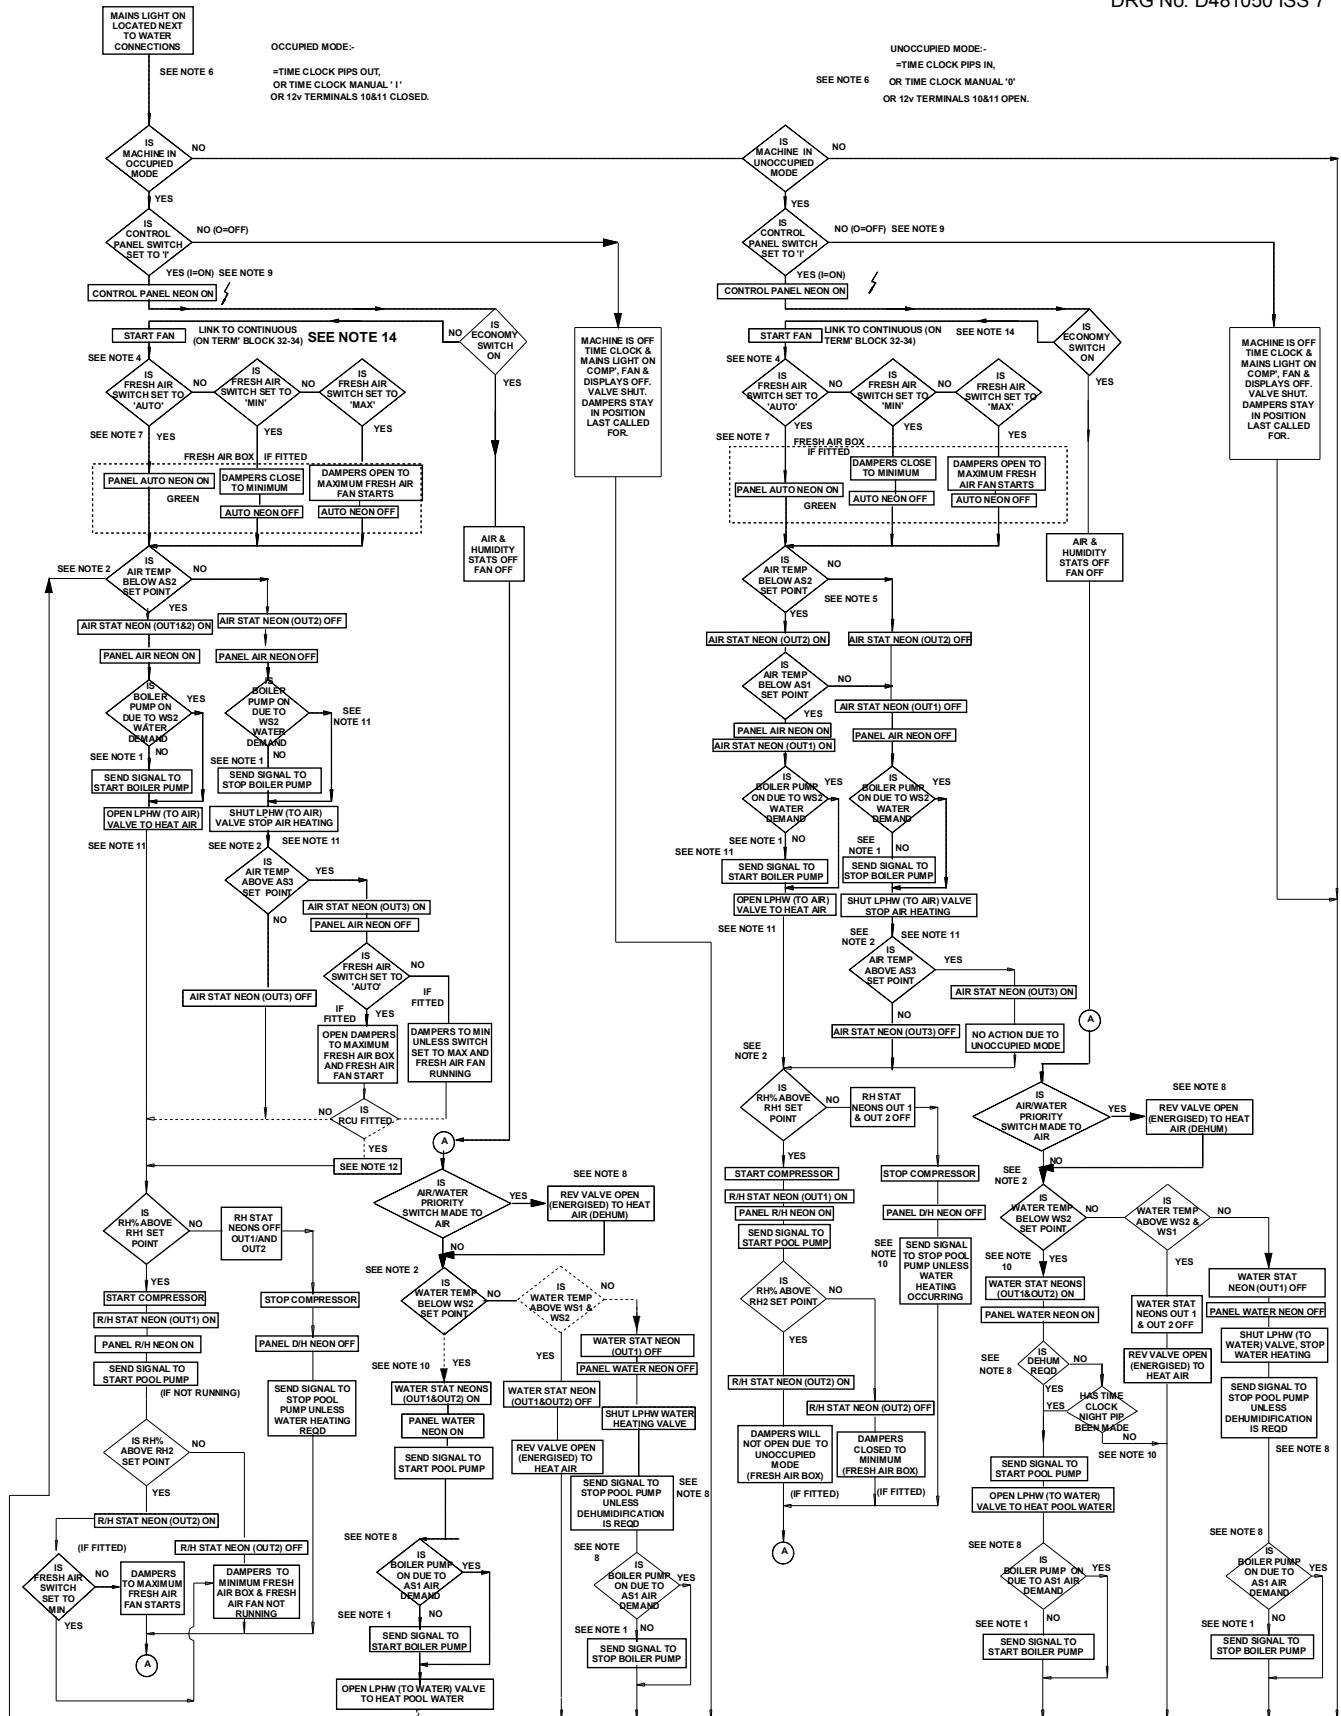

Please give MODEL NUMBER and SERIAL NUMBER of your heat pump when making technical or service enquiries. This will assist in correct diagnosis and ensure service can be provided with the minimum delay.

## 7.0 LOGIC CONTROL CIRCUITS

### NOTES

- 1) SIGNAL TO START BOILER PUMP IS VIA TERMINAL BLOCKS 6 & 7 (VOLTAGE FREE SWITCH). SIGNAL TO START POOL FILTER PUMP IS VIA TERMINAL 8 & 9 (VOLTAGE FREE SWITCH). MACHINE WILL BRING ON POOL FILTER PUMP (IF IT IS NOT ALREADY RUNNING) WHENEVER THE COMPRESSOR RUNS OR WATER HEATING IS REQUIRED (SEE NOTE 10).
- 2) SET POINT OF THERMOSTATS IS REFERRED TO AS THE SWITCHING POINT FOR SIMPLICITY WHEN IN FACT THE RELAY OPERATES AT SET POINT PLUS OR MINUS THE HYSTERESIS. (SEE GRAPHS BELOW).
- 3) WHEN MACHINE IS ON DEFROST THE FAN STOPS (UNLESS FAN IS ON DUE TO RESISTIVE HEATERS BEING WARM) BUT ALL OTHER FUNCTIONS OPERATE AS NORMAL.
- 4) IF FRESH AIR SWITCH IS SET TO 'MIN' THE DAMPERS (AIR BOX) ARE FORCED TO CLOSE AND WILL NOT BE UNDER MACHINE 'AUTO' CONTROL.
- 5) AIR STAT NEON (OUT2) WILL SHOW DEMAND ON UNOCCUPIED SETTING BUT NOTHING WILL HAPPEN BECAUSE CONTROL IS BY OUT1 STAGE OF AIR STAT (UNOCCUPIED).
- 6) TIME CLOCK MUST BE OVERRIDDEN AND UNOCCUPIED (PIPS IN) SELECTED IN ORDER THAT THE REMOTE 12V SWITCHING FEATURE CAN OPERATE.  
MACHINE TERMINALS 11 & 12 ARE 12VAC      OPEN CIRCUIT = UNOCCUPIED  
CLOSED CIRCUIT = OCCUPIED
- 7) AUTO PANEL NEON ONLY WORKS WITH AIR BOX FITTED.
- 8) DEHUMIDIFICATION/AIR HEATING DOES NOT HAPPEN WHEN IN ECONOMY MODE.
- 9) IF REMOTE ON/OFF LINK (TERMINAL 12 & 13) IS REMOVED MACHINE WILL NOT START.
- 10) IN ECONOMY MODE WHEN WATER HEATING IS REQUIRED THE POOL PUMP RUNS AND LPHW VALVE OPENS ONCE THE 60 min TIME DELAY HAS TIMED OUT.  
IN UNOCCUPIED MODE (AND NOT ECONOMY), POOL PUMP AND LPHW WILL ONLY OPERATE ONCE THE TIME CLOCK HAS PIPPED (OCCUPIED) OR DEHUMIDIFICATION STARTS, THEN KEEPS RUNNING UNTIL THE WATER TEMPERATURE IS SATISFIED.
- 11) RESISTANCE HEATER CAN SOMETIMES REPLACE AIR LPHW. (BOILER PUMP WILL NOT START WITH AIR RESISTANCE HEATING).
- 12) RCU IS ENERGISED ON AS3 IN OCCUPIED MODE ONLY. RCU FAN WILL START WITH COMPRESSOR, AND CHANGE RCU SOLENOID VALVE FROM A TO B (A CLOSES - B OPENS) UNLESS MACHINE IS IN DEFROST MODE WHICH WILL THEN KEEP VALVE A ENERGISED.
- 13) TEST SHEETS (CERTIFICATE OF PERFORMANCE) PART NoS A444050 to 57.
- 14) WHEN FAN IS SET TO CYCLE MODE, FAN ONLY RUNS WHEN MACHINE HAS DEHUMIDIFICATION OR AIR HEATING DEMANDS. CYCLE MODE IS TERMINALS 33 & 34 LINKED (MADE), LINK TERMS 32 & 34 IN CONTINUOUS MODE.

CHECK DEFROST MODE SEE NOTES 3 & 12

## **NOTES**

1) SIGNAL TO START BOILER PUMP IS VIA TERMINAL BLOCKS 6 & 7 (VOLTAGE FREE SWITCH).

2) "SET POINT" OF THERMOSTATS IS REFERRED TO AS THE SWITCHING POINT FOR SIMPLICITY WHEN IN FACT THE RELAY OPERATES AT SET POINT, PLUS OR MINUS THE HYSTERESIS. (SEE GRAPHS BELOW).

3) WHEN MACHINE IS ON DEFROST THE FAN STOPS BUT ALL OTHER FUNCTIONS OPERATE AS NORMAL.

4) IF FRESH AIR SWITCH IS SET TO 'MIN' THE DAMPERS (AIR BOX) ARE FORCED TO CLOSE AND WILL NOT BE UNDER MACHINE 'AUTO' CONTROL.

5) AIR STAT NEON (OUT2) WILL SHOW DEMAND ON UNOCCUPIED SETTING BUT NOTHING WILL HAPPEN BECAUSE CONTROL IS BY OUT1 STAGE OF AIR STAT (UNOCCUPIED)

6) TIME CLOCK MUST BE OVERRIDDEN AND UNOCCUPIED (PIPS IN) SELECTED IN ORDER THAT THE REMOTE 12v SWITCHING FEATURE CAN OPERATE.

MACHINE TERMINALS 10 & 11 ARE 12vac, OPEN CIRCUIT = UNOCCUPIED,  
CLOSED CIRCUIT = OCCUPIED.

7) PANEL AUTO NEON (GREEN) ONLY WORKS WHEN AIR BOX FITTED.

8) IF REMOTE ON/OFF LINK (TERMINAL 12 & 13) IS REMOVED MACHINE WILL NOT START.

9) RESISTANCE HEATER CAN SOMETIMES REPLACE AIR LPHW. (BOILER PUMP WILL NOT START WITH AIR RESISTANCE HEATING).

10) R.C.U. IS ENERGISED ON AS3 IN OCCUPIED MODE ONLY. (R.C.U. FAN WILL START) WITH COMPRESSOR, AND CHANGE R.C.U. SOLENOID VALVES FROM A TO B (A CLOSES - B OPENS) UNLESS M/C IS IN DEFROST MODE WHICH WILL THEN KEEP VALVE A ENERGISED.

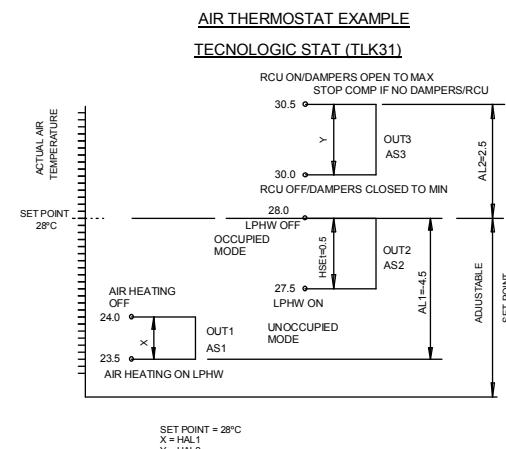

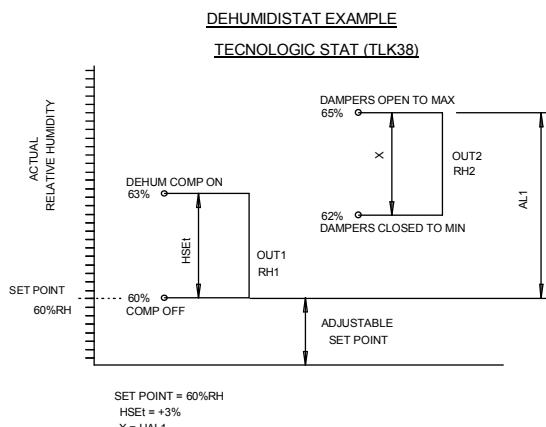

11) WHEN FAN IS SET TO CYCLE MODE, FAN ONLY RUNS WHEN MACHINE HAS DEHUMIDIFICATION OR AIR HEATING DEMANDS. CYCLE MODE IS TERMINALS 33 & 34 LINKED (MADE). FIT LINK BETWEEN TERMS 32 & 34 TO RUN MACHINE IN CONTINUOUS MODE.

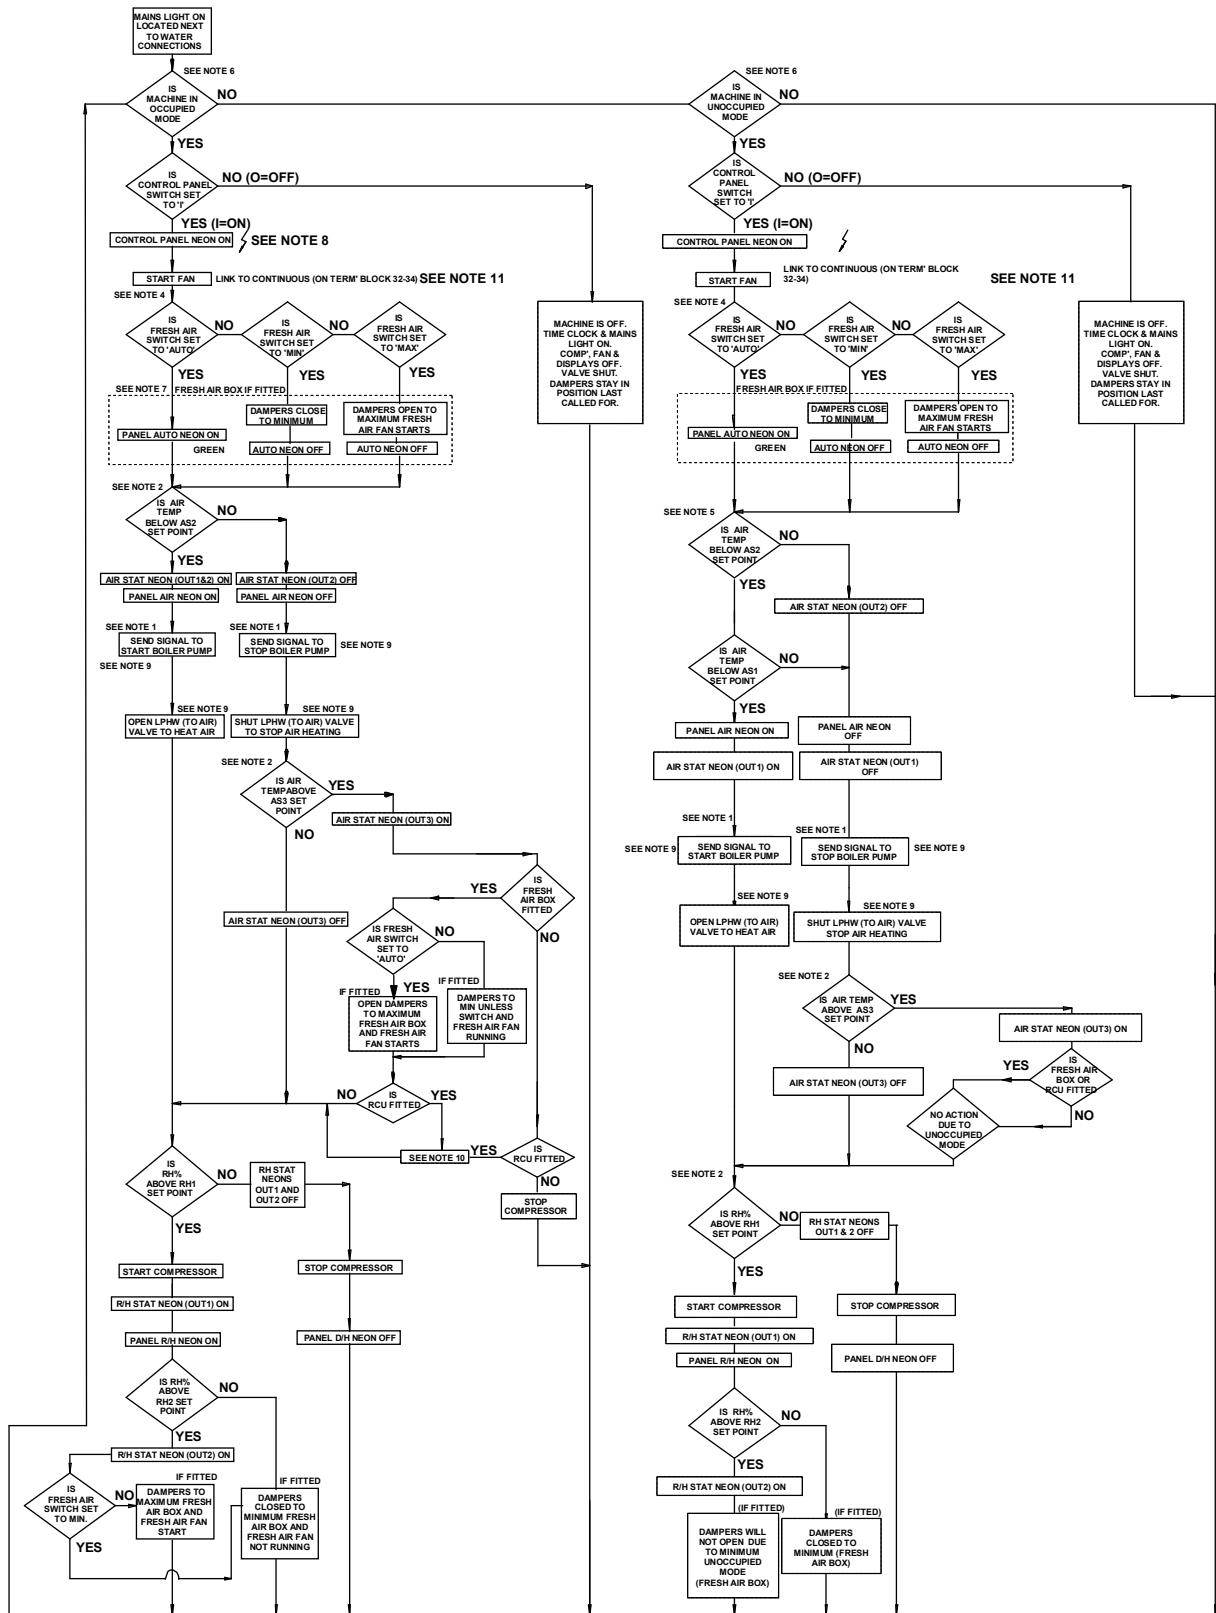

### OCCUPIED MODE:-

### UNOCCUPIED MODE:-

=TIME CLOCK PIPS OUT,  
OR TIME CLOCK MANUAL 'I'  
OR 12V TERMINALS 10&11 CLOSED.

=TIME CLOCK PIPS IN,  
OR TIME CLOCK MANUAL '0'  
OR 12V TERMINALS 10&11 OPEN.  
RH2 = DEHUM STAT STAGE 2 (DAMPERS OPEN)  
AS1 = AIR STAT STAGE 1 (LPHW HEAT AIR) UNOCCUPIED MODE  
AS2 = AIR STAT STAGE 2 (LPHW HEAT AIR) OCCUPIED MODE  
AS3 = AIR STAT STAGE 3 (A/C COOL AIR. DAMPERS OPEN)

CHECK DEFROST MODE SEE NOTES 3 & 10

## **NOTES**

- 1) "SET POINT" OF DIGITAL CONTROLLERS IS REFERRED TO AS THE SWITCHING POINT FOR SIMPLICITY WHEN IN FACT THE RELAY OPERATES AT SET POINT PLUS OR MINUS THE HYSTERESIS. (SEE GRAPHS BELOW).
- 2) WHEN MACHINE IS ON DEFROST, FAN STOPS BUT ALL OTHER FUNCTIONS OPERATE AS NORMAL.
- 3) IF FRESH AIR SWITCH IS SET TO 'MIN' THE DAMPERS (AIR BOX) ARE FORCED TO CLOSE AND WILL NOT BE UNDER MACHINE 'AUTO' CONTROL.
- 4) PANEL AUTO NEON (GREEN) ONLY WORKS WHEN AIR BOX FITTED.
- 5) IF REMOTE ON/OFF LINK (TERMINAL 12 & 13) IS REMOVED MACHINE WILL NOT START.
- 6) RCU IS ENERGISED ON AS2, RCU FAN WILL START WITH COMPRESSOR, AND CHANGE RCU SOLENOID VALVES FROM A TO B (A CLOSES - B OPENS) UNLESS M/C IS IN DEFROST MODE WHICH WILL THEN KEEP VALVE A ENERGISED.
- 7) WHEN FAN IS SET TO CYCLE MODE, FAN ONLY RUNS WHEN MACHINE HAS DEHUMIDIFICATION OR AIR HEATING DEMANDS. CYCLE MODE IS TERMINALS 33 & 34 (LINKED (MADE) LINK TO TERMS 32 & 34 IN CONTINUOUS MODE.8) IF REMOTE ON/OFF LINK (TERMINAL 12 & 13) IS REMOVED MACHINE WILL NOT START.

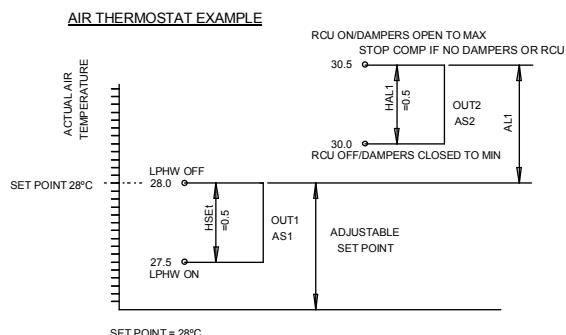

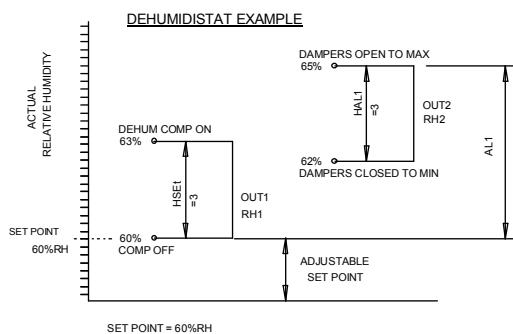

RH1 = DEHUM STAT STAGE 1 (COMP ON)

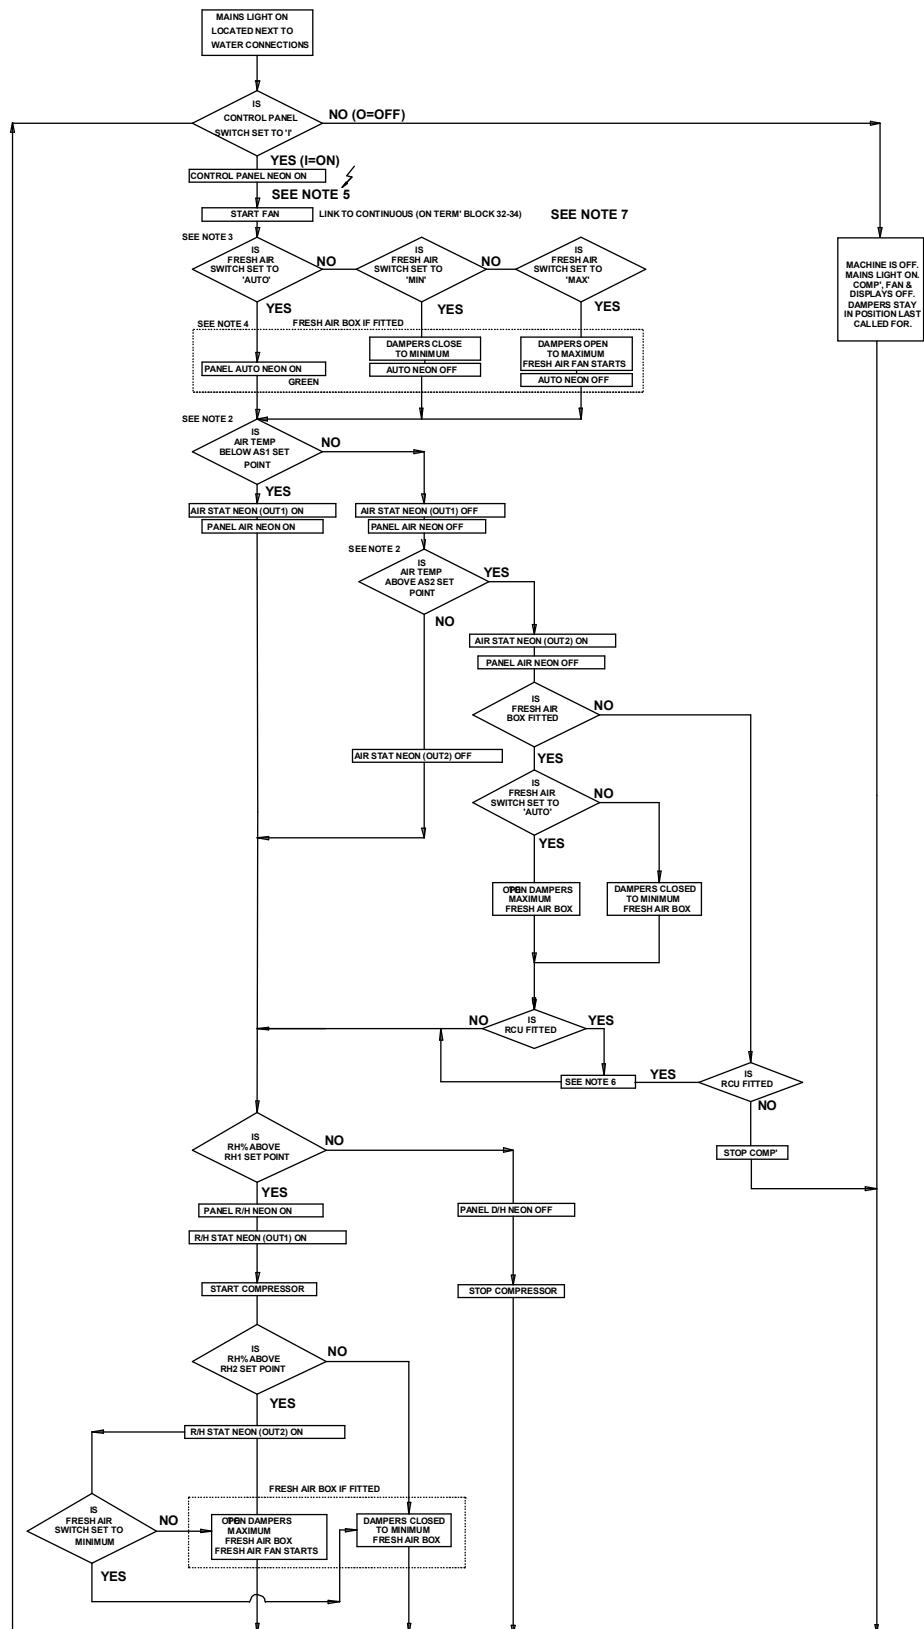

RH2 = DEHUM STAT STAGE 2 (DAMPERS OPEN)

AS1 = AIR STAT STAGE 1 (HEAT AIR).

AS2 = AIR STAT STAGE 2 (A/C COOL AIR. DAMPERS OPEN).

TECNLOGIC STATS (TLK38)

CHECK DEFROST MODE SEE NOTES 2 & 6

## 7.1 RELAY FUNCTIONS

- R1 Energised on power on switch being made on AA and AA+LPHW /resistance heating.  
Energised on power on switch being made and economy switch in the full operation mode on the AW. When not energised and the machine is switched on allows the pool pump & water LPHW to operate in economy mode once 60 min timer on AW machine (if fitted) has timed out, when water temperature is below stage 1.
- R2 Energised when stage 1 (unoccupied) or stage 2 in occupied mode. Air heating is needed bring on the LPHW air valve or resistance heater (used on AA machine to bring on the fan if air is below stage 1. R4 has to be made in occupied mode). It will also bring on the fan on all machines if fan is not already running.
- R3 Energised when dehumidification is needed as long as LP and HP pressure switches are not in fault mode.
- R4 Energised when time clock is in occupied mode on AA+LPHW / resistance heating and AW machine. On AA with air box or RCU energised once the power switch is made.
- R5 Energised on humidity still rising above stage 2, which in turn will open the dampers (only if air box is fitted and R4 is energised).
- R6 Energised when damper switch on control panel is switched from auto mode (only if air box is fitted).
- R7 Energised to switch the air box to max (if air box is fitted).
- R8 Energised when water temperature is above stage 2 it energise the reversing valve to send dehumidification heat to air (AW machine only).
- R9 Energised if LPHW water heating is required to start the pool pump only in the occupied mode and economy mode or if at any time dehumidification is happening (AW machine only).
- R10 Energised by relay 9 to bring on water LPHW valve. Only if water temperature is below stage 1 in occupied mode only. (AW machine only).
- R11 Used on AA / AA+LPHW / resistance heating machine without options to stop dehumidification once air temperature is above stage 2 on AA machine, above stage 3 on AA+LPHW / resistance heating.
- R12 Used only if RCU unit is fitted energised if air temperature is above stage 2 on an AA machine with out time clock or stage 3 on all other machines.
- R13 Used only on AW machine to start LPHW water heating and pool pump if water temperature is below stage 1 in the occupied mode only.
- R14 Provides volt free contacts for remote 'control power' indication.
- RE 1 Energised by R2 to bring on the fan when the fan is wired to cycle mode when air temperature is low.
- RE 2 Energised in defrost mode to bring on defrost lamp and if RCU is fitted to change back to valve A if RCU is calling for, valve B when machine is in defrost mode.
- RE 3 Energised once R1 is made unless the soft start has a fault or soft start link is broken.  
Which would cause RE 3 to drop out bring on the fault lamp.
- RE 4 Provides volt free contacts for fan running.

## 7.2 PARAMETER SETTINGS

### SETTING INSTRUCTIONS (TECNOLOGIC STATS, TLK 38, TLK 31)

NOTE : These parameter settings are programmed by the supplier to the figures shown below and should not need altering. See Section 3.2 for description of how to alter customer settings.

#### 1a. To Program the Set Point (Humidity and Water).

Press down P, SP1 and Set Point value (e.g. 60) will be displayed alternately. Press the ▲ or ▼ key to change the value of SP1. Once the desired value is displayed press P to memorise the value. The display will revert to the present reading.

NOTE : If anything else shows on the display leave alone for 1 minute, until the display returns to normal.

#### 1b. To Program the Set Point (Air)

Press down P, SP1 and Set Point value (e.g 28) will be displayed alternately. Press 'P' again, AL1 and AL1 value (-4.5) will be displayed alternately. This is the difference between the Set Point and AL1 plus HSEt e.g  $28 - 4.5 + 0.5 = 24^{\circ}\text{C}$  Night set back or unoccupied temperature.

SP1 and AL1 can be changed in the same way as described above for all Variheats

**2. To Program the Parameters.** Press and hold down the P key for approximately 2 seconds. You will enter the Programme Control Group Menu. Press the ▲ key to reach ConF, then press P again. Enter the Password -281 by holding the ▼key. If you pass -281 press the ▲ key to go back, then press P again, this will take you into the Programmable Group Menu. Press the ▲ or ▼ key to get into the relevant group and press P again. You should now be at the first parameter of that group. To read or change the setting press P, then to change the setting (if needed) press the ▲ or ▼ key. Once the correct setting is reached press P again. To move to the next setting press the ▲ or ▼ key and repeat above.

\*NOTE Some functions are not present, either because they are instrument dependant or because they are disabled.

To return to Programmable Group Menu leave keys alone for 20 seconds approx. To return to Normal Mode leave alone for a further 20 seconds approx.

LbA LOOP CONTROL INTERRUPTED	CHECK WORKING OF PROBE AND ACTUATOR AND SWAP INSTRUMENT TO rEG CONTROL
EfEP POSSIBLE ANOMALY OF EPROM MENU	PUSH P KEY

### Programming the offset

If the reading on the digital controller is not the same as the actual pool hall air temperature, water temperature or relative humidity, it may be necessary to program the offset.

Press and hold the P key for approximately 2 seconds. You will then enter the programme control group menu. Press the up key to reach ConF, then press P again and enter the password -281 by holding the down key. If you pass -281 use the up key to go back, then press P again. This takes you into the programmable group menu. Press the up or down key to get to group  $\Rightarrow$ InP and then press P again. Press the up key until OFSt is displayed. This parameter can be adjusted by pressing the P key and then the up and down key until the Technologic stat reading and the actual reading are the same.

Example: If the Pool water is 26.0°C and the digital controller reads 25.5°C the offset to be entered is +0.5.

When the correct offset has been inserted, leave the stat alone for 20 seconds and the display will return to normal. Great care should be taken to leave all other parameters at their factory settings.

## SETTING INSTRUCTIONS (TECNOLOGIC STATS, TLZ11)

NOTE : These parameter settings are programmed by the supplier ready for use. The parameter tables below should only be needed for reference. See Section 3.2 for description of how to alter customer settings.

### 1a. To Program the Set Point (Air and Water).

Press down P, SP1 and Set Point value (e.g. 60) will be displayed alternately. Press the ▲ or ▼ key to change the value of SP1. Once the desired value is displayed press P to memorise the value. The display will revert to the present reading.

NOTE : If anything else shows on the display leave alone for 1 minute, until the display returns to normal.

2. To program the parameters. Press and hold the P key for approximately 2 seconds, until the display shows '0', the programme control menu. Enter the password 281 by holding the ▲ key. If you pass 281 press the ▼ key to go back. Then press P again. This will take you into the programmable menu.  
To read or change the setting press P, then to change the setting (if needed) press the ▲ or ▼ key. Once the correct setting is reached press P again. To move to the next setting press the ▲ or ▼ key **and repeat above.**

**To return to normal mode leave alone for a further 20 seconds approx.**

## SETTING INSTRUCTIONS (STORK STATS)

**NOTE:** THESE PARAMETER SETTINGS ARE SET BY CALOREX AT THE FACTORY TO THE FIGURES SHOWN BELOW AND SHOULD NOT NEED ALTERING. SEE SECTION 3.2 FOR DESCRIPTION OF HOW TO ALTER CUSTOMER SETTINGS.

1. WITH MAINS LIGHT ON, PRESS DOWN  $\triangle \nabla$  TOGETHER AND HOLD.
  2. WHEN 'P1' IS DISPLAYED PRESS  $\triangle$  AND HOLD UNTIL 'P32' IS DISPLAYED.
  3. PRESS AND HOLD  $\triangle \nabla$ , WHEN 'PA' APPEARS PRESS TOGETHER  $\triangle \nabla$  UNTIL 'A1' APPEARS.
  4. PRESS AND HOLD 'SET' TO SHOW SETTING AND ALTER USING  $\triangle$  OR  $\nabla$ .
- WHEN REQUIRED SETTING DISPLAYED RELEASE 'SET' AND MOVE TO 'A2' USING  $\triangle$
5. REPEAT ABOVE PROCEDURE TO TABLE BELOW UNTIL ALL 'A' SETTINGS COMPLETED
  6. PRESS AND HOLD  $\triangle \nabla$  UNTIL 'P1' APPEARS, THEN PRESS 'SET' TO SHOW SETTING.
  7. REPEAT 'P' SETTINGS AS 'A' SETTING PROCEDURE.
  8. WHEN ALL SETTINGS COMPLETED CONTROL WILL REVERT TO NORMAL DISPLAY.

## 14.1 FAN LINK SETTINGS FOR 600/900/1200 UNITS

The fan used in the 600 and 900 Variheats is a constant flow fan. Inside the fan terminal box are 7 switches that determine certain characteristics of the fan. These switches are set up in the factory and should not need adjustment.

## 19.0 REMOTE SENSOR BOX

REMOTE SENSOR BOX SA473601  
TOP SIDE OF BASE (COVER REMOVED)

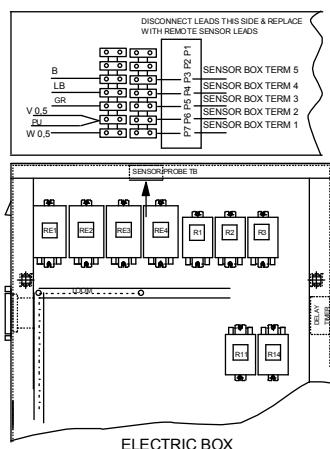

SA473601				
ITEM	PART No.	DESCRIPTION	QUAN	UNITS
001	SD260351	HUMIDITY SENSOR	1.00	off
002	SD448750	PTC SENSOR LEAD (TECNOLOGIC)	1.00	off
003	SA098761	5 WAY TERMINAL BLOCK 6A	1.00	off

NOTE:

HUMIDITY SENSOR STYLE VARIES WITH MANUFACTURER (DIXELL XH20P SHOWN)  
TERMINAL LAYOUT FOR EACH HUMDITY SENSOR

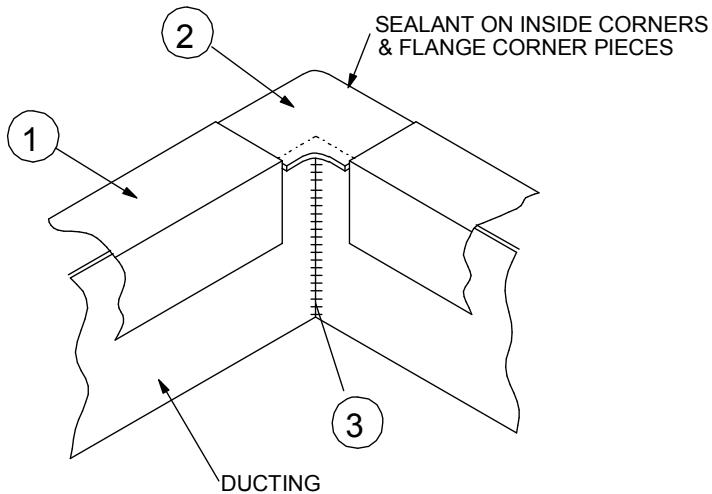

SENSOR	VOLT SUPPLY	OV COM	0-10 V
DIXELL	1	2	3
RENSE	5	3	4

RECOMMENDED INTERFACE CABLE : CALOREX PART No. D523450, 6 CORE SCREENED CABLE.

## 20.0 DUCT FLANGE KITS

### DUCT FLANGES INSTALLATION INSTRUCTIONS

#### ITEM DESCRIPTIONS

- ITEM 1 DUCT FLANGE SD347650  
ITEM 2 FLANGE CORNER PIECES SD347550  
ITEM 3 SILICON SEALANT D250350

#### NOTES

1. USING TABLE BELOW CUT DUCT FLANGES TO SIZES STATED FOR REQUIRED MACHINE
2. PUSH CORNER PIECES ( 4 OFF ITEM 2 ) INTO FLANGES TO FORM REQUIRED DUCT SIZE.
3. PUSH ASSEMBLED FLANGE ON TO DUCT, & GENTLY TAP HOME.
4. SEAL ALL INSIDE CORNERS USING SILICONE SEALANT.

MODEL	DUCT DESCRIPTION	DUCT FLANGE CUT SIZES (ITEM 1)
VARIHEAT 3 - 6/900	INLET DUCT	2 OFF 585mm LENGTHS & 2 OFF 630mm LENGTHS
VARIHEAT 3 - 12/1500	INLET DUCT	2 OFF 660mm LENGTHS & 2 OFF 750mm LENGTHS
VARIHEAT 3	OUTLET DUCT	2 OFF 260mm LENGTHS & 2 OFF 303mm LENGTHS

## **21.0 FROST PROTECTION KITS**

**NOTES**

FROST PROTECTION KIT DESCRIPTION  
USED TO PROTECT LPHW FROM FROST DAMAGE.  
SYSTEM ENERGISES WHEN AMBIENT TEMPERATURE DROPS  
BELOW 0°C DEGREES.

FOR CIRCUIT DIAGRAM REFER TO STANDARD MACHINE  
WIRING DIAGRAM D459850/I SHEET 2

**FITTING INSTRUCTIONS**

1. FIT THERMOSTAT INTO ELEC BOX AS SHOWN. POSN VARIES ACCORDING TO LAYOUT OF MACHINE.
2. DISCONNECT EXISTING R/WIRE FROM R/T TERM AND REWIRE AS SHOWN ON D459856 USING R/WIRE LISTED CUT TO REQD LENGTH & CRIMP ON TERMINALS.  
ALSO IF REQUIRED REFER TO STANDARD MACHINE WIRING DIAGRAMS : D459850 or D459851
3. ROUTE CAPILLARY AS SHOWN ON RELEVANT MACHINE LAYOUT AND FIX PROBE AS SHOWN TO LPHW BRACE.
